APPENDIX F

AIR QUALITY

Project: Biorn GPA. Unpaved Road Dust
Date: 31-Jan-05

HEAVY CONSTRUCTION PM_{10} EMISSIONS

	Debris	Soil
Silt Content (%)	30	15
Moisture Content (%)	2	3.4

	Volume (cf/day)	Emissions (lb/day)
Building Demolition	0	0.0

E (lb/day) = cf * 0.00042 (SCAQMD CEQA Handbook, 1993)

	Wind Speed (mph)	Emissions (lb/ton)	Total Tons/day	Emissions (lb/day)
Debris Loading	12	0.0035	0	0.0

E (lb/ton) = 0.35 * 0.0032 * (wind speed/5)^1.3/(moisture/2)^1.4 (Section 13.2.4, EPA, 1995)

	Emissions (lb/hr)	Total Hours/day	Emissions (lb/day)
Land Clearing	7.85	0	0.0

E (lb PM10/hr) = 0.75 *silt^1.2/moisture^1.4 (Table 11.9.2, EPA, 1995)

	TSP lb/VMT	% PM10	Emissions lb PM10/VMT	Total VMT/day	Emissions (lb/day)
Scraper soil removal	20.2	50	10.1	0	0.0

E (lb PM10/VMT) = 20.2 * %PM10 (Table 13.2.3-1, EPA, 1995)

	Weight (tons)	Emissions (lb PM10/VMT)	Total VMT/day	Emissions (lb/day)
Scraper travel	48	2.6313	0	0.0

E (lb PM10/VMT) = 0.6 * 6.2E-6 * silt^1.4 * weight^2.5 (Table 11.9.2, EPA, 1995)

	Wind Speed (mph)	Emissions (lb/ton)	Total Tons/day	Emissions (lb/day)
Soil dumping	12	0.0017	0	0.0

E (lb/ton) = 0.35 * 0.0032 * (wind speed/5)^1.3/(moisture/2)^1.4 (Section 13.2.4, EPA, 1995)

	Speed (mph)	Emissions lb PM10/VMT	Total VMT/day	Emissions (lb/day)
Motor grading	5	0.7650	0	0.0

E (lb PM10/VMT) = 0.6 * 0.051 * speed^2 (Table 11.9.2, EPA, 1995)

	Speed (mph)	Weight (tons)	Number Wheels	Days Rain per Year	Emissions lb PM10/VMT	Total VMT/day	Emissions (lb/day)
Unpaved Roads-Loaders (2)	10	30.0	4	40	3.95	200	789.9

E (lb PM10/VMT) = 0.36 * 5.9 * silt/12 * speed/30 * (weight/3)^0.7 * (wheels/4)^0.5* (365-days rain)/365 (Section 13.2.2, EPA, 1995)

	Speed (mph)	Weight (tons)	Number Wheels	Days Rain per Year	Emissions lb PM10/VMT	Total VMT/day	Emissions (lb/day)
Unpaved Roads-Trucks	10	40	18	40	10.25	240	2459.3

E (lb PM10/VMT) = 0.36 * 5.9 * silt/12 * speed/30 * (weight/3)^0.7 * (wheels/4)^0.5* (365-days rain)/365 (Section 13.2.2, EPA, 1995)

	Area (ac)	Emissions (lb/acre/day)	Emissions (lb/day)
Wind Erosion	4.9	26.4	129.4

E (lb/day) = acres * 26.4 (SCAQMD CEQA Handbook, 1993)

TOTAL Demolition Emissions (lb/day): **0.0**
TOTAL Construction Emissions (lb/day): **3378.5**

TOTAL Mitigated Construction Emissions (lb/day): **1201.9**

Mitigation based on watering: 65% reduction for unpaved roads and 50% reduction for wind erosion

Scenario:	Annual		
Round trips:	16000	Percent Autos:	0
Miles per trip:	23	Percent LDT:	0
		Percent MDT:	0
		Percent HDT:	100
		Sum	100

2004 Inclusive -- Summer

AIR QUALITY HEALTH RISK ASSESSMENT

PORTABLE STAND-ALONE ASPHALT PLANT
NIPOMO, CALIFORNIA

January 24, 2005

EXECUTIVE SUMMARY

This health risk assessment (Nipomo HRA, or HRA) presents toxic air contaminant (TAC) source identification, air dispersion modeling and risk calculation at residential receptors for equipment associated with operation of a portable, stand-alone, asphaltic concrete plant (Project). The Project is located at 2280 Hutton Road in Nipomo, California, within the unincorporated San Luis Obispo County immediately north and adjacent to the Santa Maria River, and to the south/southwest of the U.S. Highway 101 interchange with State Route 166. The property is located approximately 1,000 feet south of Cuyama Lane, north of the City of Santa Maria, in the South County Planning Area of San Luis Obispo County. Figure 1-1 shows the location of the Project.

On May 25, 2004 WCE published the *Air Quality Health Risk Assessment* (Santa Paula HRA) for a similar project located in Santa Paula, CA. A copy of the Santa Paula HRA was transmitted to San Luis Obispo Air Pollution Control District during a meeting at the District office on September 30, 2004.

The Santa Paula and Nipomo HRAs assess identical production parameters and equipment. Therefore, findings of the Santa Paula HRA are incorporated herein by reference and used in the following ways:

- Cancer risk associated with diesel particulate matter (DPM) emissions from on-road and non-road emission sources was found to comprise 99% of the risk. This HRA focuses on calculation of cancer risk from DPM emissions from the Project.
- Acute and chronic hazard indices are an order of magnitude less than their significance thresholds. This HRA does not include analysis of acute or chronic hazard indices though they are incorporated by reference of the Santa Paula HRA.

In the time between the Santa Paula HRA and this HRA, naphthalene was added to the California Air Resources Board (CARB) list of carcinogens. This HRA includes risk associated with naphthalene emissions from the asphalt plant dryer that were not included in the Santa Paula HRA.

The Project will be permitted to operate for 20 years. An average operating schedule is assumed in which the Project will operate one 10-hour shift Monday through Friday, 303 days per year in addition to 80 night shifts.

The following TAC emission sources are evaluated in this assessment:

- Truck travel onsite and in route to U.S. Highway 101 interchange with State Road 166.
- Truck idling onsite.
- Non-road engines in mobile equipment operating onsite.
- Combustion of natural gas in the drum dryer and asphalt production.

This HRA finds that:

- Cancer risk is less than the significance level of 10 in 1 million at the nearest receptor.
- Acute and chronic hazard indices (HI) are below significance level of 1.0 HI at the nearest receptor
- The Project will result in a less than significance impact (Class III).

AIR QUALITY HEALTH RISK ASSESSMENT

PORTABLE STAND-ALONE ASPHALT PLANT
NIPOMO, CALIFORNIA

January 24, 2005

1.0 INTRODUCTION

This health risk assessment (Nipomo HRA, or HRA) presents toxic air contaminant (TAC) source identification, air dispersion modeling and risk calculation at residential receptors for equipment associated with operation of a portable, stand-alone, asphaltic concrete plant (Project).

On May 25, 2004 WCE published the *Air Quality Health Risk Assessment* (Santa Paula HRA) for a similar project located in Santa Paula, CA. A copy of the Santa Paula HRA was transmitted to San Luis Obispo Air Pollution Control District during a meeting at the District office on September 30, 2004.

The Santa Paula and Nipomo HRAs assess identical production parameters and equipment. Therefore, findings of the Santa Paula HRA are incorporated herein by reference and used in the following ways:

- Cancer risk associated with diesel particulate matter (DPM) emissions from on-road and non-road emission sources was found to comprise 99% of the risk. This HRA focuses on calculation of cancer risk from DPM emissions from the Project.
- Acute and chronic hazard indices are an order of magnitude less than their significance thresholds. This HRA does not include analysis of acute or chronic hazard indices though they are incorporated by reference of the Santa Paula HRA.

In the time between the Santa Paula HRA and this HRA, naphthalene was added to the California Air Resources Board (CARB) list of carcinogens. This HRA includes risk associated with naphthalene emissions from the asphalt plant dryer that were not included in the Santa Paula HRA.

Section 2.0 contains a description of the Project, including identification of TAC emission sources and annual throughputs for each source.

Section 3.0 discusses regulation of TACs; and references that were used in the preparation of this assessment.

Section 4.0 contains specifics regarding the environmental setting in which the Project is

located. This includes other TAC sources, meteorology which affects TAC dispersion, spatial data, and nearby receptors which are the closest public receptors to the Project, and therefore, represent the maximum effects of exposure to Project TAC emissions.

Section 5.0 presents the methodologies used in the assessment including emission calculations, air dispersion modeling, and health risk calculations. Results of the assessment are provided in this section.

Section 6.0 summarizes findings of this assessment for use in CEQA review by the lead agency.

2.0 PROJECT DESCRIPTION

A J. Diani Construction Company, Inc. (Applicant) proposes to install a portable stand-alone asphaltic concrete plant. The plant is capable of using recycled asphalt products as required by CalTrans and other public agencies. The permit application includes the occasional operation of a portable lime treatment system and a portable rubberized asphalt blending system, which will be brought on site on an as-needed basis.

The Project site is located at 2280 Hutton Road in Nipomo, California, within the unincorporated San Luis Obispo County immediately north and adjacent to the Santa Maria River, west of U.S. Highway 101, and to the south/southwest of the U.S. Highway 101 interchange with State Route 166. The property is located approximately 1,000 feet south of Cuyama Lane, north of the City of Santa Maria, in the South County Planning Area of San Luis Obispo County. Figure 1-1 shows the location of the Project.

The Project will be permitted to operate for 20 years. An average operating schedule is assumed in which the Project will operate one 10-hour shift Monday through Friday, 303 days per year in addition to 80 night shifts.

This assessment calculates DPM emissions using annual throughputs presented in Table 2-1.

Table 2-1 Average Annual Throughputs

Emission Source	Throughput	Rate	Data Source
asphalt dryer	natural gas	140 MMcf/yr	Applicant
asphalt fugitives	asphalt	400,000 tpy	Applicant
asphalt tank heaters	natural gas	33.4 MMcf/yr	maximum rated input
on-road truck travel	trips	32,000 trips/yr	based on moving 25 tons/trip
on-road truck idling	minutes	10 min/truck	assumption
non-road engines	work shifts	383 shifts/yr	Applicant

3.0 REGULATORY SETTING

Technical basis for this assessment is found in the San Luis Obispo County Air Pollution Control District (SLOCAPCD) CEQA Air Quality Handbook, AB2588 Air Toxic Hotspots Program, and Proposition 65.

Diesel exhaust particulates were listed under state law as a toxic air contaminant in 1998. USEPA completed a Health Assessment Document for Diesel Engine Exhaust in May of 2002 and found that "available epidemiologic data are too uncertain to confidently derive a unit risk estimate for DE-induced lung cancer, and that rat data are not suitable for estimating human risk (Section 8.5)." USEPA has not listed diesel exhaust particulates as an air toxic but does have standards governing the composition of diesel fuel and diesel exhaust emission factors for new engines that will reduce these emissions in the future.

Due to the recent adoption of a cancer unit risk factor for naphthalene by CARB/OEHHA, this assessment includes risk associated with naphthalene emissions from the asphalt plant dryer that were not included in the Santa Paula HRA.

3.1 Significance Thresholds

Below is an excerpt from SLOAPCD Rule 219 – Toxics New Source Review – which contains significance thresholds applicable to the Project.

> *"E. **REQUIREMENTS**. The APCO shall deny an Authority to Construct or Permit to Operate for a new, modified, or relocated source of air emissions of toxic substances unless an applicant documents to the satisfaction of the APCO that the source will not adversely impact the health and welfare of the public, including off-site worksites, within the District. This documentation shall consist of, but is not limited to:*
>
> ....
>
> *4. Apply Toxics Best Available Control Technology and perform a screening or formal risk assessment which shows to the satisfaction of the APCO that the toxic impact of facility-wide emissions on the public will not result in a cancer risk equal to or greater than ten in a million population ($10.0/10^6$) or HHI equal to or greater than one (1.0) at the maximum exposed individual and the nearest receptor."*

3.2 Regulatory Resources

This assessment employs the following resources:

- Hot Spots Analysis and Reporting Program (HARP) Version 1.0 by Dillingham Software Engineering, Inc. including ISCST3 Version 99155 by USEPA (http://www.arb.ca.gov/toxics/harp/harp.htm).
- HARP User Manual, CARB, December 2003 (http://www.arb.ca.gov/toxics/harp/harp.htm).
- Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments, California Office of Environmental Health Hazard Assessment (OEHHA) August 2003 (http://www.oehha.org/air/hot_spots/HRAguidefinal.html).
- CEQA Air Quality Handbook, SLOCAPCD, April 2003. (http://www.slocleanair.org/business/pdf/handbook.pdf).
- Email dated September 2, 2004 from Bobbie Bratz of the Santa Barbara County Air Pollution Control District (SBCAPCD) regarding CEQA HRA Methodologies for Santa Barbara Cottage Hospital Foundation Workforce Housing Project.
- URBEMIS2002 (a.k.a. "Urban Emissions Model" or URBEMIS) which is the result of cooperative direction and funding of several California air districts and the California Air Pollution Control Officers Association (CAPCOA) (http://www.arb.ca.gov/planning/urbemis/urbemis2002/urbemis2002.htm).
- AP-42, USEPA (http://www.epa.gov/ttn/chief).
- AB 2588 Combustion Emission Factors, VCAPCD, May 17, 2001. (http://www.vcapcd.org/pubs/Engineering/AirToxics/combem.pdf).
- MATES II (Multiple Air Toxics Exposure Study), SCAQMD, November 1999 (http://www.aqmd.gov/matesiidf/matestoc.htm).
- Public Hearing on 1991 Air Toxics "Hot Spots" Annual Report and "Significant" Risk Level, VCAPCD, May 5, 1992 (http://www.vcapcd.org/pubs/Engineering/AirToxics/sigrisk.pdf).
- Health Assessment Document for Diesel Engine Exhaust, USEPA, May 2002 (http://oaspub.epa.gov/eims/eimscomm.getfile?p_download_id=36319).
- 2003 Traffic Volume Report for U.S. Highway 101 by Traffic and Vehicle Data Systems Unit, State of California, Department of Transportation, Traffic Operations Division. (http://www.dot.ca.gov/hq/traffops/saferesr/trafdata/2003all/r101i.htm)
- CARB's Diesel Exhaust and Naphthalene Fact Sheets, September 1997. (http://www.arb.ca.gov/toxics/tac/toctbl.htm)
- SLOAPCD Rule 219, March 24, 1999. (http://www.arb.ca.gov/DRDB/SLO/CURHTML/R219.htm)

4.0 ENVIRONMENTAL SETTING

4.1 Nearby Sources

U.S. Highway 101 is the primary south-north route crossing the City of Santa Maria and lies approximately 400 ft to the east of the Project site. Traffic ranges from 53,000 average daily traffic volume (ADT) just north of the City to 61,000 ADT immediately south of the City (2003 Traffic Volume Report). Health risk from freeway traffic to receptors near the freeway is estimated to be approximately two (2) orders of magnitude higher than the significance thresholds that are applied to the Project under CEQA and used in this study.

Stationary sources are regulated by SLOCAPCD under Rule 402, Nuisance, and through implementation of the CARB AB2588 Air Toxic Hotspots Program. AB2588 requires that CARB inventory TACs in order to identify hotspots in the community. Interestingly, the SCAQMD has found that "because risk levels ascribed to nearby sources inventoried for the study are generally much lower than region-wide risk levels, region-wide risks tend to overwhelm any potential local 'hot spots' (Mates II, Section 7.3)."

Nevertheless, a list of stationary sources located in the 93444, 93454, and 93454 zip codes that are regulated by SLOCAPCD and SBCAPCD under AB2588 is provided in Appendix 2.

4.2 Meteorological Data

SLOCAPCD provided the following meteorological (Met) data that was input into HARP:

Location:	Nipomo
Year:	1996
File Name:	NIP96_FV.ASC

A wind rose map was generated from this data and is presented in Figure 3 (Appendix 1). The predominant wind directions are west to east and east to west.

4.3 Spatial Data

Universe Transverse Mercator (UTM) coordinates were used in this assessment. The Northing UTM coordinate is specified as the distance in kilometers between the point of interest (e.g. source or receptor) and the equator of the earth. The Easting UTM coordinate is the distance from the point to the baseline for UTM Zone 11. UTM coordinates used in this assessment are based on the USGS, NAD27, Zone 11 map.

4.4 Receptors

Sensitive receptors (e.g. schools, hospitals, daycare facilities, etc.) were identified using Thomas Brother's Guide, the published list from California Department of Social Services, and Yahoo! Maps. No sensitive receptors are located within 1.3 miles from the Project site.

Residential receptors surrounding the Project site include:

- **Receptor 1**. A single residence is located approximately 790 feet northwest of facility boundary (UTM 733821, 3875400).
- **Receptor 2**. Residences are located approximately 2,000 feet south of facility boundary (UTM 734090, 3874460). Santa Maria River runs between the residences and the facility.

These receptors are shown on Figure 1-1 in Appendix 1.

5.0 IMPACT ASSESSMENT

The following Project TAC emission sources are evaluated in this assessment and the Santa Paula HRA which is incorporated by reference:

- Truck travel onsite and in route to U.S. Highway 101;
- Truck idling onsite;
- Non-road engines in mobile equipment operating onsite; and
- Combustion of natural gas in the dryer and asphalt production.

CARB's Diesel Exhaust and Naphthalene fact sheets discuss the properties and health effects of diesel exhaust and naphthalene present in Project emissions and are presented in Appendix 3. The properties and health effects of other TACs are contained in the Santa Paula HRA.

5.1 Emission Calculations

Emission calculations are based on methodologies discussed in this section and Project throughput parameters presented in Table 2-1. Air Quality Assessment report (AQA) emission calculations assume maximum operating schedule and are different from the emission calculations performed in this HRA. Because a maximum operating schedule does not represent actual operations, emission calculations for this HRA use an average operating schedule. Appendix 5.c. presents the differences between the AQA and HRA.

- AQA did not evaluate idling emissions. This HRA includes on-road truck idling at the site.
- Haul truck emission factors are the same as Santa Paula HRA but activity is specific to the Nipomo Project. Santa Paula HRA URBEMIS DPM (0.156 lbs/day) was used to ratio the trip distance for Nipomo (0.879 Nipomo miles / 1.829 Santa Paula miles).
- Water truck emissions were calculated using non-road emission factors in the AQA but the truck is actually an on-road vehicle. This HRA uses on-road HHDT emission factors (same as haul trucks) and an average activity of 10 roundtrips within the facility per day.
- The AQA assumes that the Bobcat operates 10 hr/day. This unit is used primarily for cleanup of spilled material and maintenance. Therefore, the hours of operation are believed to be less and this HRA assumes an average of 2 hr/day of bobcat operation.
- The AQA assumes that the welding unit operates one (1) hr/day. This unit is used primarily for non-routine maintenance and construction. Therefore, the hours of operation are believed to be less and this HRA assumes an average of one (1) hr/week of welding unit operation.
- The AQA assumes that the two proposed front-end loaders will operate a combined total of 20 hr/day. However, the Project will not operate 20 hr/day each and every day. Therefore, this HRA uses average hours per day based on 303 regular and 80 night shifts per year to determine an average activity of 12.6 hrs/day.
- AQA Table 4-7 presents utility truck DPM emissions of 0.0 lb/day because the amount is less than the significant figures for the overall calculation. This HRA uses the parameters in AQA Appendix 4 (10 VMT/day x 0.094 g/VMT / 453.5924 g/lb) to determine that the emissions are 0.0021 lb/day.

5.1.1 Stationary Sources

AP-42 and VCAPCD emission factors were used to calculate naphthalene emissions from natural gas combustion in the drum dryer and asphalt production.

Naphthalene emission calculation results are presented Appendix 4. The remainder TAC calculations are presented in the Santa Paula HRA.

5.1.2 Mobile Sources

URBEMIS2002 was used to estimate DPM emissions from diesel engines operating onsite and in route to the freeway including:

- Non-Road Engines. Front End Loader, a Bobcat-Type Loader, and Welding Truck.
- Haul Truck Travel. Trucks will travel a distance of 0.88 mile roundtrip from freeway to the Project and back to the freeway.
- Haul Truck Idling. EMFAC2002 emission factors were used for the idling trucks. Model years between 2005 and 2024 with a 25 year old fleet were used.
- Water Truck Travel.

Emission calculation results for mobile sources are presented in Appendix 5. The emission calculation methodologies for the idling trucks, haul trucks, and water truck are the same as the Santa Paula HRA and are not presented in Appendix 5.

5.2 Dispersion Modeling

The HARP air dispersion modeling module was used in this assessment to determine concentration of DPM at receptors. The module incorporates the Industrial Source Complex Short Term (ISCST3) source code designed by USEPA. The HARP implementation of ISCST3 uses the ratio of concentration, χ ($\mu g/m^3$), to emission rate, Q (g/s), to calculate a dispersion coefficient, χ/Q, for each source/receptor combination. By modeling an emission rate of 1 g/s, concentration changes due to each source, at each receptor, can be calculated by multiplying χ/Q by the actual emission rate for the source.

Emissions from Section 5.1 are allocated to specific model sources. Stationary sources have stack parameters (e.g. temperature, height, velocity) that affect how TACs will be dispersed. This assessment uses the following model sources:

- **Point Sources**. Point sources are stationary sources that are equipped with a stack.
  a. Drum dryer
- **Area Sources**. Area sources are used for non-road mobile emission sources that will operate on-site. They were created in areas where activity is most likely to occur including:
  a. Between the RAP Stockpile and RAP Plant;
  b. Between RAP Plant and Asphalt Plant; and
  c. Between Aggregate Stockpiles and Asphalt Plant.
- **Line Sources**. Line sources are used for on-road emission sources (e.g. traveling and idling haul trucks).

All receptors modeled in this assessment are 1.5 meters in height. In addition to the receptors discussed in Section 4.4, receptors were placed along the site boundary and in a grid with 50-meter spacing that covers the area most affected by Project TAC emissions.

5.3 Risk Assessment

The HARP risk analysis module uses χ/Q as discussed in Section 5.2 to calculate the risk from each source that will be experienced at each receptor location. Once calculated, risk from all sources is summed for each receptor to obtain the results presented in this section.

HARP calculates the cancer risk using one of several available point-estimates of exposure. This study uses the Derived (OEHHA) Method which was the recommended method by Bobbie Bratz of SBCAPCD in an email dated September 2, 2004.

This assessment evaluates risk over the life of the Project which is 20 years. The risk assessment was run for 9 year adult exposure and adjusted to 20 years.

Appendix 6 contains HARP model output and a table showing health risk calculated as described above. Table 5-1 summarizes risk results for this assessment. The Santa Paula HRA contains the results for acute and chronic hazard indices.

Table 5-1 Cancer Risk Results

Parameter	Receptor 1	Receptor 2
Cancer Risk[1]	9.43 (9.33)	3.52 (3.49)
Threshold[1]	10	10
Significant	**No**	**No**

[1] Excess cancer cases per million people exposed. Numbers in parentheses are for DPM and naphthalene.

6.0 FINDINGS

This HRA finds that:

- Cancer risk is less than the significance level of 10 in 1 million at the nearest receptor.
- Acute and chronic hazard indices (HI) are below significance level of 1.0 HI at the nearest receptor
- The Project will result in a less than significance impact (Class III).

Appendix 3

Description of Health Effects

DIESEL EXHAUST

Diesel exhaust is currently in the identification phase as a proposed Toxic Air Contaminant under California's air toxics program (AB 1807). A draft document published in May, 1997 is available.

CAS Registry Number: N/A

Molecular Formula: N/A

Diesel exhaust is a complex mixture of gases, vapors, and fine particles. Some of the exhaust components, like arsenic, benzene and nickel, are known to cause cancer in humans. At least 40 other components, including suspected human carcinogens benzo[a]pyrene, 1,3-butadiene and formaldehyde, are listed by the United States Environmental Protection Agency (U.S. EPA) as hazardous air pollutants and the Air Resources Board (ARB) as toxic air contaminants (see Table 1). Diesel Exhaust also contains carbon monoxide, oxides of nitrogen, sulfur dioxide, hydrocarbons, particulate matter (PM), aldehydes, ketones, sulfates, cyanides, phenols, ammonia, and metals. Some of these substances can result from unburned fuel and lubricating oil components, products of incomplete combustion, or a result of engine wear or trace contaminants (Volkswagen, 1989).

In this substance review, California's population exposure to diesel exhaust PM is discussed in more detail because more is known about the PM fraction, and most researchers believe that the diesel exhaust particles contribute the majority of the risk from exposures to diesel exhaust.

Diesel exhaust particles carry many of the harmful organics and metals present in the exhaust. Typical diesel exhaust particles have mass-median aerodynamic diameters ranging from 0.1 to 0.25 micrometers (μm) (Groblicki and Begeman, 1979; Dolan et al., 1980; NRC, 1982; Williams, 1982). More than 75 percent of the particles are smaller than 1 μm (Pierson et al., 1983) and are mainly aggregates of spherical elemental carbon particles coated with organic and inorganic substances. The particles have a sponge-like structure and large surface area which attracts compounds of low volatility to the inside or surface of the particles. The primary organic compounds associated with the particles include aliphatic hydrocarbons, polycyclic aromatic hydrocarbons (PAH), and PAH-derivatives (Zielinska, 1990). Methylated PAHs appear to be the most abundant PAH derivatives and more than 50 nitro-PAHs have been identified in diesel exhaust (ARB, 1997d).

TABLE 1 - TOXIC AIR CONTAMINANTS FOUND IN DIESEL EXHAUST*

acetaldehyde	chlorine	methyl ethyl ketone
acrolein	chlorobenzene	naphthalene
aluminum	chromium compounds	nickel
ammonia	cobalt compounds	4-nitrobiphenyl
aniline	copper	phenol
antimony compounds	cresol	phosphorus
arsenic	cyanide compounds	**POM (including PAHs)
barium	dibenzofuran	propionaldehyde
benzene	dibutylphthalate	selenium compounds
beryllium compounds	ethyl benzene	silver
biphenyl	formaldehyde	styrene
bis [2-ethylhexyl]phthalate	hexane	sulfuric acid
bromine	lead compounds	toluene
1,3-butadiene	manganese compounds	xylene isomers and mixtures
cadmium	mercury compounds	zinc
chlorinated dioxins	methanol	

(ARB, 1997d)

* This list of toxic air contaminants have either been identified in diesel exhaust, or presumed to be in the exhaust based on observed chemical reactions and/or presence in the fuel or oil.

** See Polycyclic Organic Matter (POM) Fact Sheet.

SOURCES AND EMISSIONS

A. Sources

Diesel exhaust PM emissions can be emitted from mobile sources (on-road vehicles and off-road mobile sources), stationary area sources, and stationary point sources. On-road diesel vehicles contribute approximately 59 percent of California's diesel exhaust PM. Other mobile sources contribute about 36 percent, and stationary area and point sources contribute the remaining amount. Stationary area sources of diesel exhaust include shipyards, warehouses, heavy equipment repair yards, and oil and gas production operations where exhaust emissions result from multiple locations within the site (ARB, 1997d). The primary stationary sources that have reported emissions of diesel exhaust are heavy construction (except highway), electrical services, and crude petroleum and natural gas extraction (ARB, 1997b).

B. Emissions

The total emissions of diesel exhaust from stationary sources in California are estimated to be at least 31,000 pounds per year, based on data reported under the Air Toxics "Hot Spots" Program (AB 2588) (ARB, 1997b). Also, based on the ARB 1990 emissions inventory, approximately 58,000 tons of diesel exhaust PM_{10} from all sources are emitted into California air each year (ARB, 1997d).

Emissions from on-road mobile source diesel exhaust PM_{10} in California are expected to decline by approximately 50 percent from 1990 until about 2010 as a result of mobile source standards and regulations already adopted by the ARB through 1996. The expected reduction is mainly due to adopted diesel vehicle emission and fuel regulations, even though both the number and vehicle miles traveled (VMT) of heavy-duty trucks are expected to increase during this period. Similarly, NO_x emissions from on-road diesel vehicles have been reduced since 1990, and will continue to be reduced through 2010 because of new NO_x engine emission standards (ARB, 1997d).

C. Natural Occurrence

Diesel exhaust is a product of diesel fuel combustion and does not occur naturally in the environment.

AMBIENT CONCENTRATIONS

The ARB has conducted a preliminary estimation of diesel exhaust concentrations for California's 15 air basins using a PM-based exposure method. This method used the ARB emissions inventory's database for particulate matter 10 microns or smaller (PM_{10}); ambient PM_{10} monitoring network data; and the results from several studies where chemical speciation of ambient data was performed, along with receptor modeling techniques to estimate statewide outdoor concentrations of diesel exhaust PM_{10}. The statewide population-weighted average diesel exhaust PM concentration is estimated to be 3.2 micrograms per cubic meter ($\mu g/m^3$). The basin-wide average diesel exhaust PM estimates ranged from 0.3 (in the Great Basin Valley) to 3.6 $\mu g/m^3$ (in the South Coast Air Basin) (ARB, 1997d).

INDOOR SOURCES AND CONCENTRATIONS

To estimate Californians' exposures to diesel exhaust particles, ARB staff used estimates of population-weighted ambient diesel exhaust particle concentrations in a model that can estimate indoor air concentrations, population indoor air exposure, and total air exposure. The model, called the California Population Indoor Exposure Model (CPIEM), was recently developed under contract to the ARB to improve estimates of population exposures to toxic air pollutants. The model uses relevant data (such as distributions of California building air exchange rates, activity patterns data, and air concentrations of diesel exhaust particles) as inputs to develop indoor concentration estimates across all environments.

The average indoor exhaust particle concentrations estimated by the model ranged from 1.7 $\mu g/m^3$, in office buildings to 3.2 $\mu g/m^3$ in industrial plants and inside vehicles. These estimates were combined with activity pattern data in the model to estimate Californians' exposures across all enclosed environments. The exposure modeling results indicate that Californians were exposed to average diesel exhaust particle concentrations of 2.1 $\mu g/m^3$ in enclosed environments in 1990. This is two-thirds of the population-weighted ambient average outdoor diesel exhaust PM_{10} concentration (ARB, 1997d).

ATMOSPHERIC PERSISTENCE

Physical removal of diesel exhaust PM from the atmosphere is usually accomplished through accretion of the particles, atmospheric fall-out (dry deposition), and atmospheric removal by rain (wet deposition). The particles, generally smaller than 1 μm, are expected to remain in the atmosphere from 5 to 15 days (Pierson et al., 1983; Balkanski et al., 1993).

AB 2588 RISK ASSESSMENT INFORMATION

Although diesel exhaust is reported as being emitted in California from stationary sources, no health values (cancer or non-cancer) are listed in the California Air Pollution Control Officers Association Air Toxics "Hot Spots" Program Revised 1992 Risk Assessment Guidelines for use in risk assessments (CAPCOA, 1993).

HEALTH EFFECTS

The probable route of human exposure to diesel exhaust is inhalation (ARB, 1994b).

Non-Cancer: Non-cancer effects of diesel exhaust are likely due to the presence of particles in the exhaust (WHO, 1994). A Recent study has reported that exposures to airborne respirable particulate matter are associated with increased morbidity and mortality, with observed effects including respiratory symptoms, changes in lung function, and increased hospitalizations for respiratory and cardiovascular disease (Pope et al., 1995a). Cellular changes upon exposure to particles include an accumulation of particle-laden macrophages and proliferation of bronchiolar epithelium of type II alveolar cells. Studies by Ulfvarson and coworkers (in 1990 and 1991) showed pulmonary function increases after a workshift during which diesel exhaust was removed from the work environment (Ulfvarson et al., 1990; 1991).

In June of 1993, the U.S. EPA determined an inhalation Reference Concentration (RfC) of 5 $\mu g/m^3$ for non-cancer effects of diesel exhaust. The U.S. EPA estimates that inhalation of this concentration or less, over a lifetime, would not likely result in the occurrence of chronic non-cancer effects (ARB, 1997d).

The available literature does not provide sufficient information to determine whether or not diesel exhaust exposure induces reproductive, developmental or teratogenic effects in humans. Exposure via inhalation did not induce sperm abnormalities nor affect spermatogonial survival in mice and monkeys though sperm anomalies have been observed in hamsters. Data on the effects of diesel exhaust on female reproductive capacity are limited, but potential effects on the corpora lutea and mating period have been suggested for laboratory rodents. Rats born to dams exposed to high concentrations of diesel exhaust had delayed ossification of the chest. Exposure during the neonatal developmental period of rodents induces neurobehavioral and neurophysiological effects, but does not affect general lung development. Generational studies conducted in rodents revealed that inhalation exposure to diesel exhaust resulted in increases in lung weight in all generations examined (ARB 1997d).

Cancer: Epidemiological studies in truck drivers, transport and equipment workers, dock workers, and railway workers, reported a statistically significant increase in the incidence of lung cancer associated with exposure to diesel exhaust. Two studies reported no category with a risk ratio elevated for exposure to diesel exhaust (ARB, 1997d; HEI, 1995).

In the last decade, results of inhalation bioassays of rodents have demonstrated the carcinogenicity of diesel exhaust. Seven studies in rats exposed to greater than 2 milligrams per cubic meter (mg/m^3) of whole diesel exhaust longer than 24 months, reported statistically significant increases in lung tumors (ARB, 1994b; Heinrich, 1995; Nikula, 1995). An exposure of 2.0 mg/m^3 compromises the clearance capacity of the rat lung. Studies of other rodents have been less extensive. The results in mice were mixed, depending on the strain. All three studies in hamsters were negative (ARB, 1997d).

The International Agency for Research on Cancer (IARC) concluded in 1989 that there is sufficient evidence that whole diesel engine exhaust probably causes cancer in humans and classified diesel exhaust in Group 2A: Probable human carcinogen (IARC, 1989a). The National Institute of Occupational Health and Safety recommended that whole diesel exhaust be regarded as a potential occupational carcinogen (NIOSH, 1988). The Office of Environmental Health Hazard Assessment is in the process of evaluating diesel exhaust as a potential toxic air contaminant (ARB, 1997d). The U.S. EPA is currently in the process of developing a health assessment for diesel exhaust; their first draft was released December 1995. The State of California has determined under Proposition 65 that diesel engine exhaust is a carcinogen (CCR, 1996).

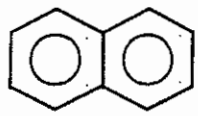
Diesel exhaust is currently in the identification phase as a proposed Toxic Air Contaminant under California's air toxics program (AB 1807). The first draft report was released in June 1994 for a six month comment period. A workshop was held in September 1994 to discuss the draft report. To further our understanding of the human health effects of diesel exhaust, the Office of Environmental Health Hazard Assessment, Health Effects Institute, World Health Organization, National Institute of Occupational Safety and Health, United States Environmental Protection Agency, and the ARB sponsored a scientific workshop to discuss the use of epidemiological data in developing quantitative cancer risk estimates for diesel exhaust. The workshop was held on January 29-30, 1996 in San Francisco.

NAPHTHALENE

Naphthalene is a federal hazardous air pollutant and was identified as a toxic air contaminant in April 1993 under AB 2728.

CAS Registry Number: 91-20-3

Molecular Formula: $C_{10}H_8$



Naphthalene is a white crystalline, volatile solid with an odor of mothballs. It sublimes at room temperature. Naphthalene is insoluble in water and is soluble in benzene, absolute alcohol, ether, carbon tetrachloride, carbon disulfide, hydronaphthalenes, and in fixed and volatile oils (Merck, 1989).

Physical Properties of Naphthalene

Synonyms: tar camphor; naphthalin; white tar; naphthene; naphthaline

Molecular Weight:	128.16
Boiling Point:	217.9 °C
Melting Point:	80.2 °C
Flash Point:	174 °F (open cup)
Vapor Density:	4.42 (air = 1)
Density/Specific Gravity:	1.162 at 20/4 °C
Vapor Pressure:	0.082 mm Hg at 25 °C
Log Octanol/Water Partition Coefficient:	3.30
Conversion Factor:	1 ppm = 5.24 mg/m^3

(Howard, 1990; Merck, 1989; Sax, 1987; Sax, 1989)

SOURCES AND EMISSIONS

A. Sources

Naphthalene is produced from petroleum refining and coal tar distillation. Naphthalene is used as a chemical intermediate in the production of phthalic anhydride, naphthol, and chlorinated naphthalenes. It is also used in smokeless powder, cutting fluids, lubricants, antiseptics, synthetic resins, tanning products, preservatives, textile chemicals, emulsion breakers, and scintillation counters (Sax, 1987; Howard, 1990). It is also found in combustion processes including refuse combustion, tobacco smoke, coal tar pitch fumes, and oil spills.

The primary stationary sources that have reported emissions of naphthalene in California are paper mills, manufacturers of miscellaneous wood products, and electrical services (ARB, 1997b). Naphthalene has also been detected but not quantified in motor vehicle exhaust by the Air Resources Board (ARB) (ARB, 1995e).

Naphthalene was registered for use as a pesticide; however as of December 31, 1992, it is no longer registered for pesticidal use in California (DPR, 1996).

B. Emissions

The total emissions of naphthalene from stationary sources in California are estimated to be at least 360,000 pounds per year, based on data reported under the Air Toxics "Hot Spots" Program (AB 2588) (ARB, 1997b).

C. Natural Occurrence

Naphthalene is a component of crude oil and is also a product of natural uncontrolled combustion (U.S. EPA, 1994a).

AMBIENT CONCENTRATIONS

No ARB data exist for ambient measurements of naphthalene. However, ambient air sampling was conducted in Redlands, California on selected days and nights from October 19 through 28, 1994. A total of seven 12 hour daytime and six 12 hour nighttime samples were collected. The observed 12 hour average ambient concentrations of naphthalene ranged from 348 to 715 nanograms per cubic meter (ng/m^3) or 0.07 to 0.14 parts per billion (ppb) (Atkinson, 1995).

In addition, the United States Environmental Protection Agency (U.S. EPA) has compiled ambient data from urban and suburban locations throughout the United States. Mean concentrations were reported at 530 ng/m^3 (0.10 ppb) in 5 urban to suburban locations from 1974-82, 470 ng/m^3 (0.09 ppb) in Boston during 1990-91, 436 ng/m^3 (0.08 ppb) in Houston from 1990-91, 530 ng/m^3 (0.10 ppb) in Chicago during 1991, and 330 ng/m^3 (0.06 ppb) in Kankakee, Illinois during 1991. The overall concentrations ranged from the limit of detection to 2,560 ng/m^3 (0.49 ppb) (U.S. EPA, 1993a).

INDOOR SOURCES AND CONCENTRATIONS

No information about the indoor sources and concentrations of naphthalene was found in the readily-available literature.

ATMOSPHERIC PERSISTENCE

Naphthalene exists in the atmosphere in the gas phase. The reaction with the hydroxyl (OH) radical dominates as a naphthalene loss process, leading to a calculated half-life and lifetime of naphthalene due to reaction with the OH radical of 11 hours and 16 hours, respectively. The products of this reaction are 1- and 2-naphthol, 1- and 2-nitronaphthalene (also formed from the nighttime nitrate (NO_3) radical reaction) and ring-opened dicarbonyls (Atkinson, 1995).

AB 2588 RISK ASSESSMENT INFORMATION

The Office of Environmental Health Hazard Assessment reviews risk assessments submitted under the Air Toxics "Hot Spots" Program (AB 2588). Of the risk assessments reviewed as of December 1996, for non-cancer effects, naphthalene contributed to a total chronic hazard index greater than 1 in 15 of the approximately 89 risk assessments. Naphthalene also contributed to a total acute hazard index greater than 1 in 2 of approximately 107 risk assessments (OEHHA, 1996b).

HEALTH EFFECTS

Probable routes of human exposure to naphthalene are inhalation, ingestion, and dermal contact (U.S. EPA, 1994a).

Non-Cancer: Vapors are highly irritating to the eyes and may cause cataracts upon chronic exposure. Acute exposure to naphthalene may cause methemoglobinemia and hemolytic anemia as well as damage to the kidneys. Symptoms may include headache and nausea (U.S. EPA, 1994a). Individuals with glucose-6-phosphate dehydrogenase deficiency may be at increased risk.

A chronic non-cancer Reference Exposure Level (REL) of 14 micrograms per cubic meter is listed for naphthalene in the California Air Pollution Control Officers Association Air Toxics "Hot Spots" Program, Revised 1992 Risk Assessment Guidelines. The toxicological endpoint considered for chronic toxicity is the cardiovascular or blood system (CAPCOA, 1993). The U.S. EPA has not established a Reference Concentration (RfC), and an oral Reference Dose (RfD) for naphthalene is under review (U.S. EPA, 1994a).

Hemolytic anemia has been reported in infants born to mothers who sniffed and ingested naphthalene (as mothballs) during pregnancy (U.S. EPA, 1994a).

Cancer: Di-, tri-, and tetramethyl naphthalene contaminants of coal tar were found to be carcinogenic when applied to the skin of mice, but naphthalene alone was not. The U.S. EPA has placed naphthalene in Group D: Not classifiable as a carcinogen (U.S. EPA, 1994a). The International Agency for Research on Cancer has not classified naphthalene for its carcinogenicity (IARC, 1987a).

Assumptions

Trucks travel an average of 15 miles per hour onsite and in route from Highway 166.

Annual Peak Rate DPM Emissions for Nipomo is estimated based on the ratio in haul truck trip distance between Nipomo and Santa Paula Projects.

APR (2005) = (0.28 lbs/day) x (0.88 miles/1.83 miles) = 0.135 lbs/day

	Total	**39.79**				**205.10**		

1 Air Quality Assessment Report (AQA) did not evaluate idling emissions. This HRA includes on-road truck idling at the site.

2 Haul truck emission factors are the same as Santa Paula HRA but activity is specific to the Nipomo Project. Santa Paula HRA URBEMIS DPM (0.156 lbs/day) was used to ratio the trip distance for Nipomo (0.879 Nipomo miles / 1.829 Santa Paula miles). Please see Truck Travel Emissions spreadsheet (Appendix 5.b.).

3 Water truck emissions were calculated using non-road emission factors in the AQA but the truck is actually an on-road vehicle. This HRA uses on-road HHDT emission factors (same as haul trucks) and an average activity of 10 roundtrips within the facility per day.
Sample Calculation: (22.73 lbs/yr) x (10 trucks/day) / (106 trucks/day) = 2.14 lbs/yr

4 The AQA assumes that the Bobcat operates 10 hr/day. This unit is used primarily for cleanup of spilled material and maintenance. Therefore, the hours of operation are believed to be less and this HRA assumes an average of 2 hr/day of bobcat operation.

5 The AQA assumes that the welding unit operates one (1) hr/day. This unit is used primarily for non-routine maintenance and construction. Therefore, the hours of operation are believed to be less and this HRA assumes an average of one (1) hr/week of welding unit operation.

6 The AQA assumes that the two proposed front-end loaders will operate a combined total of 20 hr/day. However, the Project will not operate 20 hr/day each and every day. Therefore, this HRA uses average hours per day based on 303 regular and 80 night shifts per year to determine an average activity of 12.6 hrs/day.

7 AQA Table 4-7 presents utility truck DPM emissions of 0.0 lb/day because the amount is less than the significant figures for the overall calculation. This HRA uses the parameters in AQA Appendix 4 (10 VMT/day x 0.094 g/VMT / 453.5924 g/lb) to determine that the emissions are 0.0021 lb/day.

453.5924 g/lb

Appendix 6

Risk Calculations and HARP Software Output

Appendix 6.a. Cancer Risk Calculations

Receptor	Eastern UTM (m)	Northern UTM (m)	9-Yr Risk Adult	20-Yr Risk[1]	Risk from DPM (in 1 Million)	Total Risk[2] (in 1 Million)
Receptor 1	733821	3875400	4.20E-06	9.33E-06	9.33	9.43
Receptor 2	734090	3874460	1.57E-06	3.49E-06	3.49	3.52

[1] The adjusted risk is calculated by multiplying the 9 year risk with the ratio (20/9):

Cancer Risk (Receptor 1) = $4.20 \times 10^{-6} \times (20 \text{ yrs} / 9 \text{ yrs}) = 9.33 \times 10^{-6}$

[2] Total risk assumes that DPM and naphthalene comprise of 99% of cancer risk and is calculated as follows:

Total Risk (Receptor 1) = 9.78 / 0.99 = 9.88
