The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

As a native Central Coast resident, born and raised in this beautiful community, I would hate to see this area devastated by an oil spill. First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A

derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and DELIBERATELY OMITTS important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project. As someone who lives close enough to a rail line to be within the blast zone, I am horrified and angered by your complete disregard for life.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this project pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death. As usual Phillips (and all Big Oil) does not give a damn about life and health.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train

carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate. For many of us, approval of this project may well be the difference between our living and dying (something about which Phillips does not give a damn). How can your county possibly be complicit with this kind of risk.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I lived in California for 30 years, 20 of it in Hanford. Coming to the Central California Coast was the best part of those years. San Simeon Creek campground is still my favorite vacation place ever! So I feel that I have a right to comment, even though I have since moved to Washington State (to get married). Please don't let anything mess up SLO County. The coast is so beautiful there - don't take a chance on the damage from exploding oil trains.

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposa

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact the Santa Maria community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state. The tracks go through heavily populated cities in the Bay Area, in many cases rolling down city streets.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. it is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours, g. Becker

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

History is watching you!

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours, RR

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

People of San Jose need protection against this potential threat. With more and more residential housing being built around the downtown San Jose tracks, it becomes more concerning that hazardous materials will be railed through our streets. Please make a point to reach out to current SJ Mayor Reed and Mayor-elect Sam Liccardo before making decisions which affect our homes.

I am expressing deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution.

For all the aforementioned reasons, I urge you to REJECT the Phillips 66 proposed rail spur.

Regards,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers or write this note since citizens are also decision makers in this regard.

JUST WRITE THIS: MAKE IT PERSONAL FOR MORE EFFECT.

COUNTY PLANNING AND BUILDING

DEAR MR. WILSON,

PLEASE REJECT THE PHILLIPS 66 EIR AND PROJECT APPLICATION FOR A SPUR TRACK AT THEIR NIPOMO REFINERY. IT IS INADEQUATE AND WE DO NOT WANT OIL TRAINS RUNNING THROUGH OUR COUNTY.

SINCERELY,

(SIGN, DATE AND PRINT YOUR NAME, ADDRESS, PHONE AND EMAIL)

IF YOU DO NOT HAVE THE TIME TO HAND DELIVER IT TO THE COUNTY YOURSELF BEFORE 4:30PM NEXT MONDAY, DO THIS. CALL ME AT 805-234-6666 AND LET ME KNOW WHERE AND WHEN I CAN PICK UP YOUR NOTE. I WILL PERSONALLY MAKE SURE THAT THE COUNTY RECEIVES IT BEFORE THE CUT-OFF TIME. THE HAND WRITTEN NOTES WILL PROBABLY BE MORE EFFECTIVE THAN EMAILS. BUT, EMAILS ARE BETTER THAN NOTHING. SEND THEM TO mwilson@co.slo.ca.us

THANK YOU,

ROGER LONGDEN

PS: THIS IS PROBABLY THE MOST UNUSUAL REQUEST THAT YOU WILL SEE ALL YEAR. YOU MIGHT ALSO WANT TO THINK ABOUT ATTENDING THE COUNTY PLANNING HEARING ON THIS MATTER NEXT JANUARY. TENTATIVE DATE IS THE 29TH A THURSDAY.

Begin the standard message please

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

The time for CLEAN ENERGY INVESTMENT, not continuing dirty oil that won't even benefit the U.S., and will most likely endanger us. Taking a stand is long overdue.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Phillips 66 Rail Terminal Expansion Project
Sarah Del Grande to: p66-railsur-comments@co.slo.ca.us

11/25/2014 11:04 AM

To the Attention of Mr. Murry Wilson
SLO County Planning Department

I'm emailing you to express my strong opposition to the Phillips 66 rail terminal expansion project. I am a teacher in San Leandro, and several of our school campuses are within the blast zone through which the oil trains would travel. Therefore, I'm deeply concerned about the potential dangers associated with this entire project. Additionally, bringing tar sands oil to California will undermine our state's efforts to be a global leader addressing climate change, and these trains will put our communities directly in harm's way.

Specifically, our emergency responders are not prepared to deal with potential accidents with these heavy, dangerous trains, and the current safety standards won't protect our people and property along the blast zones. My understanding is that the draft EIR doesn't fully inform our first responders because it inadequately assesses the risks of an oil train disaster in San Leandro. The EIR only evaluates rail-accident rates between 2003 and 2012 and the spill rates between 2005 and 2009, while omitting important data about accident frequency and magnitude in more recent years. This is troubling because we know that more crude spilled from trains in 2013 than during the past four decades combined. The EIR must look at recent data, which reflects the increased quantities of crude being transported in old and unsafe tank cars.

In my role as a public school teacher on a school campus in San Leandro Unified School District, I am not prepared, nor is our District Emergency Operations Procedure plan prepared, to address this threat to our school communities. School teachers, as public employees, become state mandated emergency workers when disaster strikes. This proposed project threatens school communities along the entire north to south California rail route planned for these oil shipments.

The EIR's worst-case scenario estimates a spill of 180,000 gallons, or roughly six tank cars of crude. This has to be an error because most crude trains have 100 or more tank cars, carrying millions of gallons. Depending upon where an accident occurred, such a spill could devastate our scarce water resources, sensitive ecosystems, schools, homes, transit facilities and rail lines, businesses, and our local economy. In Alameda County, this rail route parallels major highways and urban areas in several cities, including (but not limited to) Berkeley, Oakland, San Lorenzo, and Hayward. In San Leandro, these trains would pass within less than a mile from our City Hall, Police Department, two BART Stations, and the tracks pass through the heart of our downtown.

Also, the toxic air emissions that will accompany this project pose an unacceptable risk to public health. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution along the rail route, with sulfur dioxide and other toxic chemicals leaked that increase risk of cancer, heart disease, respiratory disease and premature death.

The EIR has yet to fully analyze the worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed route brings oil trains through the San Francisco Bay-Delta watershed and along California's central coast. A derailment near a river, stream,

reservoir or aquifer could contaminate drinking water for millions of Californians, an unacceptable risk anytime, made more severe in this time of extreme drought.

The planning department must examine the cumulative impacts of the Santa Maria and Rodeo proposals as a single project -- not in isolation -- since the proposed terminal in Santa Maria is directly linked by pipeline to the Phillips 66 refinery in Rodeo. Phillips 66 is proposing to modify both facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands.

Phillips 66 must disclose crude-quality information so decision-makers fully understand the climate impacts of the proposed rail project. At every stage of the mining, transportation and refining process, Canadian tar sands are more carbon intensive than any other source of oil -- making this project simply incompatible with California's plans to be a climate leader.

We don't live in a bubble, this proposed project that you are considering in Santa Maria will affect the health and well-being of millions of people along the train routes, as well as the dangers to our school communities, environment, water resources, local economies, and private property.

For all these reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to soundly reject the Phillips 66 proposed rail spur.

With Respect,
Sarah Del Grande

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours, E. Gierson

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, our Wildlife, property and our local economy and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. it is clear that Phillips 66 wants to bring toxic Canadian tar sands to California (which I truly hope they won't). The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption. Have you ever seen - even in a photograph - the devastation that this method of extracting has done to Canadian lands? If that was only the extraction, I can't imagine what an accident with this crude oil would do - it would be Dantesque!!!

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer

could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours, Stephen P. Johnson

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.
