Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery.

These trains are literally a stone's throw from my front door. I am terrified by the thought of potentially exploding train passing in front of my apartment on a daily basis. This is irresponsible and reckless and it cannot be approved! California needs to continue to be a leader in progressive solutions to our climate crisis, not take 50 steps backwards, allowing this disgusting, dangerous cargo to move freely through our state.

We know that most crude trains are comprised of 100 or more tank cars. A worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety.

The toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community.

A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians.

At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

11/25/2014 11:03 AM

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities and our state's environment at risk. We cannot afford to place water resources or citizen health for the profits of a few.

We are ill equipped and not adequately trained to deal with an emergency the size and scope these trains might give. We know that more crude spilled from trains in 2013 than the prior four decades rendering the EIR's analysis flawed. Please, look at recent data including accident data from Canada which has also experienced increased crude by rail incidents. The data suggest that just as Earthquakes in our beloved state, it is not a matter of if, but when. The rail cars being used are proved old and unsafe.

A worst case scenario as described by the EIR estimates a spill of approximately 180,000 gallons, approximately six tank cars of crude. If most crude trains are comprised of 100 or more tank cars we are talking millions of gallons of crude, another flaw in the study. Such a spill could devastate scarce water resources, Private and public property, our local economy, threaten public health and safety.

Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes, of which one runs through my town. Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. It is unavoidable however, do not allow it. Otherwise, their report cites increased health risks, especially for children and the elderly of cancer, heart disease, respiratory disease, and premature death. These heavy externalities will not be paid for by Phillips 66 but by the citizens of California, in both lives and treasure.

The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state. This is indeed critical.

The planning department must examine the Santa Maria and Rodeo proposals as a single project. Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth, Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation being but one link in a chain.

Phillips 66 must disclose crude quality information in order for decision

The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

As a lifelong California resident, I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer

could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Please respond to Linda Bruce

Nov 24, 2014

Mr. Murry Wilson

Dear Mr. Wilson,

I am deeply concerned about the proposed crude-by-rail project at the Phillips 66 Santa Maria Refinery. This project presents significant and unacceptable risks to communities across California.

This proposal would increase the number of crude oil unit trains traveling through numerous California communities and population centers. I am concerned about the toxic air emissions resulting from these shipments, which would pose an unacceptable risk to public health. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review, Phillips 66 even admitted that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

It is also clear that communities and emergency responders along the rail route are not prepared for these heavy, dangerous trains and current safety standards are not adequate to protect the public. The recirculated draft EIR dangerously misinforms the public because it uses outdated data and does not adequately assess the risks of an oil train disaster involving an oil train carrying millions of gallons of explosive crude oil.

It's not just communities that will be put at risk. The EIR must also fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery, including the San Francisco Bay-Delta watershed and California's central coast. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

The climate impacts of Canadian tar sands crude must also be taken into account. At every stage of the mining, transportation, and refining process, tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

Finally, I urge the planning department to examine the Santa Maria and Rodeo proposals as a single project. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow them to refine tar sands, thus creating more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve the Santa Maria project in isolation.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Sincerely,

Ms. Linda Bruce

Dear Mr. Wilson,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. As a student at the University of California, Santa Barbara, and therefore resident of Goleta, the Phillips 66 project puts my community, and many others, at risk. This project presents significant and unacceptable risks to Isla Vista, Goleta, Santa Barbara, and communities across California.

First and foremost, emergency responders [in my community] are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders in Goleta because it does not adequately assess the risks of an oil train disaster. The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death. Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the

Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil.

A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state. Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,
Sarah Williams

This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for

children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for

children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for

children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours, Julie Huang

In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours, Shirley Xu

Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

This is important to us.

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A

derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours, Aniruddh

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

While I do not live close enough to the rail lines affected by these trains I have seen the horrendous damage and loss of life that can occur when, not if there should be a derailment. Local fire fighters are simply not trained or equipped to handle such an accident.

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery.

The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Protect California's kids and reject the Phillips 66 oil train proposal

The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours, robin Kibby

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours, PLEASE!!!

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

The following represents my position in strong opposition to the Phillips 66 proposed rail spur.

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train

carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

11/23/2014 08:40 AM

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am the Executive Director of The Fort Ord Environmental Justice Network. We are writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California. One such community is a huge contaminated Military site in Monterey County California. We cannot afford to have more exposures and unsafe transport coming through our communities that will cause harm to multiple families and communities. Our Air is already contaminated with toxins due to Prescribed burns, from the Army. They are using Alumajell, which is a Derivative of napalm. Monterey County also conducts Prescribed burns using diesel fuel and gasoline.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours, LeVonne Stone

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am deeply concerned about the proposed oil-by-rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude-by-rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Alarming, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, which is approximately six tank cars of crude. This must be an error because most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude, a spill that would devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true scope and impacts.

Second, Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death. The toxic air emissions resulting from this project pose an unacceptable risk to public health and significant increases in health care costs.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed, along the length of the rich agricultural fields of the Salinas Valley and along California's treasured central coast. With each oil train carrying more than 3,000,000 gallons of explosive, toxic crude oil, a derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water and food products for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands.

Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

11/22/2014 05:52 PM

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours, Carl Tilchen

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer

could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery.

This proposal is literally an accident waiting to happen.

The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta

watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

11/22/2014 03:55 PM

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

For the sake of our communities and our children, please reject the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. This project presents significant and unacceptable risks to our communities across California.

Our emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014.

Besides, the EIR's worst-case scenario estimates a spill of approximately 180,000 gallons, approximately six tank cars of crude, while most crude trains comprise 100 or more tank cars, which could lead to a spill on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals.

Third, the proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast, carrying explosive, toxic crude oil near rivers, streams, reservoirs, and groundwater aquifers. A spill could contaminate drinking water for millions of Californians.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

Mr. Murry Wilson
San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal

San Luis Obispo County Planning Department

Dear San Luis Obispo decision-makers,

I am writing to express deep concern about the proposed oil by rail project at the Phillips 66 Santa Maria Refinery. The Phillips 66 project puts communities throughout California at risk. This project presents significant and unacceptable risks to our communities across California.

First and foremost, emergency responders are not prepared for these heavy, dangerous trains and current safety standards will not protect the public. The recirculated draft EIR dangerously misinforms first responders because it does not adequately assess the risks of an oil train disaster.

The draft EIR's analysis of potential accidents and spills is flawed because it only evaluates rail accident rates from 2003 to 2012 and spill release rates between 2005 and 2009, and omits important data about crude rail accident frequency and magnitude in 2013 and 2014. This is troubling because we know that more crude spilled from trains in 2013 than spilled during the past four decades. The EIR must look at recent data, including accident data from Canada which has also experienced increased crude by rail incidents. This data reflects the increased quantities of dangerous crude being transported in old and unsafe tank cars and will provide a more accurate assessment of accident risk and magnitude along the rail lines that would serve this project.

Moreover, the EIR's worst case scenario spill analysis estimates a spill of approximately 180,000 gallons, that's approximately six tank cars of crude. This must be an error because we know that most crude trains are comprised of 100 or more tank cars. Indeed, a worst case scenario spill would be on the order of millions of gallons of crude. Such a spill could devastate our scarce water resources, property and our local economy, and would pose a significant threat to public health and safety. This project cannot be approved without analyzing and mitigating its true impacts.

Second, the toxic air emissions resulting from this problem pose an unacceptable risk to public health. The Phillips 66 project will create unacceptable levels of toxic air emissions that will impact my community. Volatile toxic chemicals leak out of tank cars into the air poisoning communities along rail routes. In its latest environmental review Phillips 66 admits that its proposed oil train facility will create "significant and unavoidable" levels of air pollution, including toxic sulfur dioxide and cancer-causing chemicals. The report cites increased health risks -- particularly for children and the elderly -- of cancer, heart disease, respiratory disease, and premature death.

Third, the EIR must fully analyze the potential worst-case scenario of a spill near each of the many watersheds crossed en route to the Santa Maria refinery. The proposed rail route brings oil trains through the San Francisco Bay-Delta watershed and along California's treasured central coast. Each oil train carries more than three million gallons of explosive, toxic crude oil. A derailment near a river, stream, reservoir, or above a groundwater aquifer could contaminate drinking water for millions of Californians. During a time

of extreme drought, SLO must not approve this project and create contamination risk for the rest of our state.

Fourth, the planning department must examine the Santa Maria and Rodeo proposals as a single project. It is clear that Phillips 66 wants to bring toxic Canadian tar sands to California. The proposed oil train terminal in Santa Maria is linked by pipeline to the Phillips 66 refinery in Rodeo, CA. Phillips 66 is proposing to modify these facilities to allow it to refine the most toxic crude oil on Earth: Canadian tar sands. Transporting and refining tar sands will create more toxic air and water pollution for families along the rail line and near the Santa Maria refinery. San Luis Obispo cannot approve this project in isolation.

Fifth, Phillips 66 must disclose crude quality information in order for decision makers to fully understand the climate impacts of the proposed rail project. Tar sands means more carbon pollution: At every stage of the mining, transportation, and refining process, Canadian tar sands are more carbon intensive than any other source of oil. Bringing tar sands to California will undermine the state's efforts to be a global leader addressing climate disruption.

For all the aforementioned reasons, I urge the San Luis Obispo County Planning Commission and Board of Supervisors to reject the Phillips 66 proposed rail spur. This project creates significant, unavoidable, and unnecessary risks for our communities and our climate.

Respectfully yours,

Reject the Phillips 66 oil train proposal
