San Luis Obispo County Public Health Department is pleased to present this Community Health Status Report for San Luis Obispo County. The creation of this report was undertaken to provide an overview of some of the key community health trends in our county. We believe that one role of public health is to systematically collect, analyze, report and disseminate information about the health of the county’s population to support community-driven health improvement strategies. This report contains information that can be used by health care providers, policy-makers, educators and other community members.

The primary sections of the report are (I) Community Overview, (II) Maternal, Child, and Adolescent Health, (III) Communicable and Infectious Diseases, and (IV) Leading Causes of Illnesses, Injury or Death. As much as possible, we have compared our local health status with that of the State, and when available, to the national Healthy People 2010 objectives. In addition to health or medically related indicators, we have also included some socio-economic factors that may influence the health status of populations.

We believe that the community is our most valuable partner in public health; therefore, we especially value your comments, questions and suggestions about the Community Health Status Report. Please send them to:

County of San Luis Obispo Public Health Department

Executive Summary

Section I: Community Overview

1) Community Profile
2) Low Income, Uninsured, and Disabled Population
3) Education
4) Housing
5) Health Care

Section II: Maternal, Child and Adolescent Health

6) Prenatal Care
7) Births
8) Breastfeeding
9) Teen Births
10) Low Birthweight
11) Infant Mortality
12) Childhood Immunizations

Section III: Communicable and Infectious Diseases

13) Communicable Disease Overview
14) HIV/AIDS
15) Sexually Transmitted Infections
16) Hepatitis A/B/C
17) Tuberculosis
18) Pneumonia and Influenza

Section IV: Leading Causes of Illness, Injury or Death

19) Leading Causes of Death
20) Chronic Diseases
21) Tobacco Use
22) Obesity and Physical Inactivity
23) Unintentional Injury Hospitalizations and Deaths
24) Suicide Attempts and Deaths
25) Asthma
**Community Profile**

**Geography:** San Luis Obispo County, one of California’s 27 original counties created in 1850, is located along the Pacific Coast, approximately 200 miles north of Los Angeles and 235 miles south of San Francisco. Most of the county’s 3,326 square miles are unincorporated. The majority of residents live along the coast or along the corridor of Highway 101. The eastern region is sparsely populated with vast areas of agricultural and government lands between small, unincorporated towns.

**Figure 1-1: San Luis Obispo County Area Map**

![San Luis Obispo County Area Map](https://example.com/sanluisobispo_map.png)

Map provided by MapQuest.com, Inc.

**Industry:** Key industries in the county include tourism, education, agriculture and government.

**Colleges / Universities:** San Luis Obispo is the home of California Polytechnic State University, with an enrollment of approximately 18,360 undergraduate and graduate students in Fall 2010, and Cuesta Community College, with three campuses in the county and a total enrollment of 13,504 students in Spring 2010.

**Population:** As of July 1, 2010, approximately 273,231 persons were living in San Luis Obispo County. Compared to California, San Luis Obispo County has a smaller percentage of its population under the age of 15. In addition, the county has a higher percentage of individuals over the age of 45, which has important implications for disease patterns and demand for health services. The median age of County residents was 37.6 in 2009, while California had a median age of 34.4. A comparison of the State and County populations, by age categories, is shown in Figure 1-2.
Race/Ethnicity of Population: In a comparison of race/ethnicity make-up, San Luis Obispo County has a higher percentage of non-Hispanic whites compared to the State of California. San Luis Obispo County also has a lower percentage of Hispanic/Latino, African American and Asian individuals compared to the State of California. A comparison of race/ethnicity is shown below in Figure 1-3.
Population Growth: According to California State Association of Counties, in 2010 San Luis Obispo County had the 23rd largest population in California (out of 58 counties). With a population of 44,948, the City of San Luis Obispo is the largest city in the county; it is also the county seat. A summary of the population growth by city/unincorporated area is provided in Table 1-1. Paso Robles was the fastest growing area from 2000 to 2010.

*As of 1/1/10

Census Projections: San Luis Obispo County has experienced steady growth since the 1970's. Figure 1-4 shows a summary of the county population and growth estimates for San Luis Obispo County according to the State Census Data Center. In the 1990's, population growth controls were established by limiting the number of new building permits issued by the county; therefore, the actual growth may be less than projected by the State.

### Figure 1-4  Population Growth in San Luis Obispo
Census Results, Estimates, and Projections 1970 - 2050

Income: According to the US Department of Commerce, Bureau of Economic Analysis, San Luis Obispo County’s per capita personal income in 2008 was $40,635 compared to $43,852 for the State. San Luis Obispo County ranked 21st highest among the state’s 58 counties for per capita personal income. The median household income for San Luis Obispo County residents has remained lower than the State’s, though it has grown over the past two decades such that it now comes very close to that of the state, as shown in Table 1-2.

Data source, 2008: U.S. Census Bureau

Unemployment: Compared to the State of California, San Luis Obispo County had a lower percentage of unemployment during the past decade. As of 2009, per the California Employment Development Department, the unemployment rate in San Luis Obispo County was 9.0%, compared to 11.4% statewide in California.

Figure 1-5: Annual Average Rate of Unemployment
San Luis Obispo County and California, 1999 - 2009

- San Luis Obispo County: 3.2, 3.0, 2.8, 3.4, 3.4, 4.4, 4.1, 3.2, 4.3, 5.7, 9.0

Low Income, Uninsured, and Disabled Population

Poverty: Poverty increases the risk of many conditions, including poor nutrition, low birth weight, cognitive and developmental delays, unaffordable and inaccessible health care, decreased mental well-being, poor academic achievement, unemployment, and inadequate housing. Death rates for people below the poverty level are much higher than those above it. Low socioeconomic status is also associated with higher risks of infectious diseases, accidents and homicides.

Table 2-1 shows the proportion of the population living at or below poverty level in San Luis Obispo County compared to the State of California, per the American Community Survey (ACS), 2009. Table 2-2 shows educational attainment for persons age 25 and over living below the poverty level. Generally, increasing levels of education are associated with decreasing percentages of the population living at or below poverty, as shown in Table 2.2.

Medi-Cal Population: Medi-Cal is California’s Medicaid healthcare program. It is jointly administered by the California State Department of Health Care Services and the Centers for Medicare and Medicaid Services. This program pays for needed medical services for individuals, including families with children, persons with disabilities, children in foster care, pregnant women, and low income people with specific diseases such as tuberculosis, breast cancer or HIV/AIDS. Medi-Cal is supported equally by federal and state taxes.
According to the California HealthCare Foundation (CHCF), Medi-Cal is the source of health coverage for one in three of the state’s children, pays for forty-six percent (46%) of all births in the state, and two-thirds of all nursing home residents. It is estimated that Medi-Cal provides services for 6.5 million Californians, or 1 in 6 Californians. In San Luis Obispo County, in 2009, Medi-Cal paid for forty-one percent (41%) of all births. Per CHCF, although California ranks second among the ten largest states in percent of population enrolled in Medicaid, it spends the least per beneficiary among those states.

Table 2-3 shows the Medi-Cal (Medicaid) eligible population for San Luis Obispo County and California for the Years 1996 – 2007, 2010. Compared to California, SLO County consistently has a smaller percentage of the population who are eligible (e.g., 11.0% versus 17.5% in 2010).

Data Source: State of California, Department of Health Care Services. Medi-Cal/Medicare Dual Eligibility By Age, By County, July 2010.
Women, Infant, and Children Program:
The Women, Infant, and Children (WIC) Supplemental Nutrition Program helps eligible low to medium income pregnant women, new mothers and young children eat well and stay healthy. The average monthly participation in WIC in San Luis Obispo County has increased from 4,227 in 2003 to 4,975 for FY 2009/2010.

Child Health Disability Program:
The Child Health Disability Prevention (CHDP) Program provides comprehensive health examinations to low-income infants, children and adolescents to help children stay healthy and find health problems early. CHDP providers are pediatricians/practitioners in the county who perform the comprehensive physical examinations according to a periodicity schedule established by the State CHDP program. Referrals from CHDP providers to specialists are made as appropriate and are documented on a CHDP form. The CHDP data for FY 2009/10 shows 9,686 San Luis Obispo County children received physical examinations. The primary medical reasons for referrals were: dental/oral (38%), eye/ear/nose/throat (25%), nutritional/growth (15%), and behavioral/developmental (8%). All chronic medical conditions (such as asthma or cardiac conditions) where a child is already receiving treatment were not included in the data.

CalWORKs:
California Work Opportunity and Responsibility to Kids (CalWORKs) is a welfare program that gives cash aid and services to eligible needy California families. County welfare departments operate the program locally. If a family has little or no cash and needs housing, food, utilities, clothing or medical care, they may be eligible to receive immediate short-term help. Families that apply and qualify for ongoing assistance receive money each month to help pay for housing, food and other necessary expenses. As of July 2008:
- 4,262 (1.6%) of the 270,004 residents of San Luis Obispo County received CalWORKs, compared to 2.8% for the California population.

SSI/SSP:
The Supplemental Security Income/State Supplementary Payment (SSI/SSP) Program provides cash assistance to aged, blind or disabled persons who meet the program’s income and resource requirements. California supplements the federal SSI payment with an SSP payment and food stamp cash equivalents. For the month of June 2009, the number of recipients of SSI/SSP in San Luis Obispo County was 263 out of 126,395 statewide. There were 24 California counties that had a higher number of SSI/SSP recipients. Data source: http://www.cdss.ca.gov/research/PG343.htm.
Uninsured Population: Recently released data from the California Health Interview Survey (CHIS) 2009 and other sources points to an increase in the number of un-insured among most age groups. Further, it is anticipated that the recent economic recession and California’s fiscal crisis has and will continue to impact insurance status among adults and children under the age of 18.

According to the 2009 California Health Interview Survey (CHIS) and the National Center for Policy Analysis (NCPA):
- 14.7% of Californians under age 65 (all income levels) are uninsured
- Children in California are less likely to be uninsured than in the rest of the nation—4.9% (CHIS) vs. 15.3% nationwide (NCPA).

See Table 2-3 for the estimated percentage of the San Luis Obispo County and California populations who were uninsured per the 2009 California Health Interview Survey (CHIS). The percentage of uninsured children rose dramatically according to CHIS 2009, at 13.4%, up from 2.9% in CHIS 2007. The approximate number of uninsured individuals in San Luis Obispo County is estimated by CHIS to be:
- 7,000 children (ages 0-17) up from 2000 in CHIS 2007.
- 24,000 non-elderly adults (ages 18-64) down from 25,000 in CHIS 2007

The 95% range (confidence interval) is provided in parenthesis.

Disabled Population: Table 2-4 shows the proportion of the population living with a disability, per the U.S. Census American Community Survey, 2009. Disabled populations are broken down into categories based on age ranges. People 5 years old and over are considered to have a disability if they have one or more of the following: (a) blindness, deafness, or a severe vision or hearing impairment; (b) a substantial limitation in their ability to perform basic physical activities, such as: walking, climbing stairs, reaching, lifting, or carrying; (c) difficulty learning, remembering, or concentrating; or (d) difficulty dressing, bathing, or getting around inside the home. In addition to the above criteria, people 16 years old and over are considered to have a disability if they have difficulty going outside the home alone to shop or visit a doctor’s office. People ages 16—64 years are considered to have a disability if they have difficulty working at a job or business.

**Note:** The Census Bureau introduced a new set of disability questions in the 2008 ACS. Comparisons of disability data from 2008 or later with data from prior years are not recommended.

**Data Sources:**
Education

Education, Health and Poverty:

Education is one of several important factors often interrelated with health. According to the National Center for Education, the better educated a person is, the more likely that a person is to report being in very good or excellent health, regardless of income. As shown in Table 2-2, educational attainment has a significant impact on poverty status.

According to the Department of Health and Human Services:

➢ Dropping out of school is associated with delayed employment opportunities, poverty, and poor health.
➢ During adolescence, dropping out of school is associated with multiple social and health problems, including substance abuse, delinquency, intentional and unintentional injury, and unintended pregnancy.

Educational Attainment:

San Luis Obispo County has a slightly higher percentage of residents with some college or more versus statewide. SLO County also has a slightly higher percentage of High School Graduates (including equivalency degrees) than the state as a whole. However, compared to the State, San Luis Obispo County has a lower percentage of residents with an education level less than ninth grade, as shown in Figure 3-1.

Figure 3-1: Educational Attainment - 25 year olds and above
San Luis Obispo County and State of California, 2009

Graduation Rate:

As shown in Figure 3-2, San Luis Obispo County has consistently had a higher percentage of high school students who graduate compared to the State of California. However, in the 2004/05 school year, San Luis Obispo County failed to meet the Healthy People 2010 objective of 90 percent for the first time since 1995. The state graduation rate has been in decline for several years.

![Figure 3-2: High School Graduation Rates](image)

Data source: California Department of Education, Educational Demographics Unit, High School Graduation Rates based on NCES Definition, http://dq.cde.ca.gov/dataquest/ (DataQuest)

High School Dropout Rates:

As shown in Table 3-1, San Luis Obispo County had a lower percentage (1-year rate) of high school students who dropped out in 2008-09 compared to California (3.3% and 5.7%, respectively), this held true for nearly every race/ethnicity group.

Data source: California Department of Education, Educational Demographics Unit. [Per the California Department of Education, the 1-year dropout rate is the percent of dropouts during a single year, calculated from actual data submitted. It is also called the "annual" or "event" rate and it is the dropout rate used by the National Center for Education Statistics to compare states and school districts.]

*Adjusted percentage may not reflect total numbers, instead reflects all students, including those found later to have re-enrolled at other schools in California.
Housing

Median Home Price: Compared to the United States, San Luis Obispo County and the State of California have a higher cost of housing (for a median-priced home), as shown in Figure 4-1. The gap had been widening significantly. In 1999, California’s median home price was about 28% higher than the national figure, and it increased to 250% higher by 2006. The housing market collapse after the sub-prime mortgage debacle has recently been depressing housing prices across the nation, but the effect has been more dramatic in California and San Luis Obispo County. Still, as seen in Table 4-2 however, San Luis Obispo is one of the least affordable housing markets in the nation.

Figure 4-1: Median Home Prices

Affordability: The percentage of households in California able to afford a median-priced home rose dramatically following the collapse of the housing market beginning in 2007, according to a report by the California Association of Realtors. The percentage of households in San Luis Obispo County able to afford a median-priced home went from 11% in 2005 to 27% in the second quarter of 2010. These numbers remain lower compared to the United States, in which 63 percent of households are able to afford a median-priced home in 2010. These data are summarized in Table 4-1.

### Other Housing Concerns:

The ACTION for Healthy Communities San Luis Obispo County Comprehensive Report (2006) also addresses concerns about a variety of other topics related to housing, including:

- Concerns about homelessness
- Homeless shelters
- Fair market rents
- Concerns about housing costs
- Housing expenses
- Housing affordability
- Housing prices

These topics will not be repeated in this report; however, we encourage you to review the ACTION for Healthy Communities report for more details about housing and homelessness. For more information about ACTION for Healthy Communities, contact:

*San Luis Obispo County Community Foundation*

P.O. Box 1580
San Luis Obispo, CA 93406
Telephone: (805) 543-2323
Facsimile: (805) 543-2346

*This report is also available at the United Way of San Luis Obispo County’s website, under Community Partners, at [http://www.unitedwayslo.org](http://www.unitedwayslo.org), and San Luis Obispo County Health Agency Epidemiology site, [http://www.slocounty.ca.gov/health/publichealth/famhealth/epi/epidemiology_data_and_publications.htm](http://www.slocounty.ca.gov/health/publichealth/famhealth/epi/epidemiology_data_and_publications.htm)*
Health Care

Basic Health Care: The ACTION for Healthy Communities San Luis Obispo County Comprehensive Report* (2009) addressed concerns about a variety of topics related to health care, including:

- Basic needs, including health care, not met
- Source of primary health care
- Last routine check-up
- Inability to receive medical care (unaffordable)
- Dental care
- Health insurance

These topics will not be repeated in this report; however, we encourage you to review the ACTION for Healthy Communities 2009 report for more details. To obtain more information, contact:

San Luis Obispo County Community Foundation
P.O. Box 1580
San Luis Obispo, CA 93406
Telephone: (805) 543-2323
Facsimile: (805) 543-2346

* This report is available at the United Way of San Luis Obispo County’s website, under Community Partners, at http://www.unitedwayslo.org, or at the San Luis Obispo County Epidemiology site, http://www.slocounty.ca.gov/health/publichealth/famhealth/epi.htm

Health Care Professionals:

- Registered Nurses (RNs): RNs are the largest healthcare occupation in the US, with approximately 2.5 million jobs held by RNs in 2006. According to the Kaiser Family Foundation, California had 630 RNs per 100,000 population in 2009, fewer than the national average of 842. There are conflicting studies regarding the number of nurses that will be available in the future. According to a UCSF study, the number of nurses per 100,000 is expected to rise forecasting out until 2030, due primarily to increasing capacity in nursing programs. (These numbers only include RNs employed in patient care.)

- Physicians: According to the California Healthcare Foundation, California had 340 physicians per 100,000 population in 2009, slightly below the national average of 350. However, this number varies widely by geography. (These numbers indicate non-federal physicians, including allopathic physicians, or MDs, and osteopathic physicians, or DOs. Retired and inactive doctors are included.)

- Dentists: According to the Kaiser Family Foundation, California had
100 dentists per 100,000 population in 2009, more than the national average of 80.

- **Pharmacists:** According to the Bureau of Labor Statistics’ Occupational Employment Statistics, California had 65.3 pharmacists per 100,000 population in May 2008 (population estimate from 1/1/08 from California Department of Finance). San Luis Obispo County had 70.2 pharmacists per 100,000 population in May 2009. California ranked 43rd among the 50 states in number of pharmacists per capita. In another study, California is ranked as one of the five states with the greatest unmet need for pharmacists in the nation. The Health Resources and Services Administration projects growth of Pharmacy Technician supply into 2030. Total numbers will be adequate if per capita consumption does not change. If utilization increases, the current shortage will continue.

- **Mental Health Professionals:** According to the American Board of Behavioral Healthcare Practice, California had at most 10 licensed psychiatrists per 100,000 in 2004. This was less than the national average of 14.2. In 2004, California also had 36.3 psychologists per 100,000, more than the national average of 28. Also in 2004, California had 40.9 social workers per 100,000, more than the national average of 35.6.

**Nursing Shortage:** California has approximately 9,900 RN job openings annually, with the number projected to grow to 116,600 by 2020 according to the State’s Employment Development Department. In California, steps to address the nursing shortage are bearing fruit, with 23 additional RN programs opening 2005-2008. In 2008, 9,580 RNs graduated from accredited programs, an increase of 54% over the previous four years. Factors affecting the supply of and demand for RNs include the number of nursing school graduates, aging of the RN workforce, relative earnings, an aging population requiring increased medical care, and the emergence of alternative job opportunities.

**Hospital Bed Capacity:** Table 5-1 provides a summary of 2005 through 2008 results for California and San Luis Obispo County hospital bed capacity by three different categories: licensed beds, available beds, and staffed beds. The 2008 available bed occupancy rate was lower in San Luis Obispo County compared to California and the staffed bed occupancy rate was slightly higher in San Luis Obispo County compared to California. Brief definitions of key terms related to hospital bed capacity follows:

- **Licensed beds:** The number of beds licensed by the Licensing and Certification Division of the Department of Health Services, less those beds in suspense, during the reporting period. [Note: Most hospitals do not operate all of
the beds for which they are licensed. In fact, for some hospitals, it would be physically impossible to do so due to lack of space.]

- **Available beds**: The number of beds (excluding bassinets) that are licensed, physically existing and actually available for overnight use, regardless of staffing levels. Beds in suspense and beds in nursing units converted to uses other than inpatient overnight accommodations (which cannot be placed back into service within 24 hours) are not included.

</table>
**Staffed beds:** The averaged number of beds that are licensed, available and for which there are staff on hand to attend to the patient who occupies the bed.

**Occupancy rate:** A measure of the usage of the beds during the reporting period that is derived by dividing the patient days in the reporting period by the bed days in the reporting period. Bed days can be calculated using licensed beds, available beds, or staffed beds.

Source: Office of Statewide Health Planning and Development website ([www.oshpd.state.ca.us](http://www.oshpd.state.ca.us)). Data obtained from the Hospital Annual Utilization Data Profile, 2009, located in the Healthcare Information Resources, Utilization section of the Hospital Data.

¹ Non-Urgent EMS Visits = a visit by a patient with a non-emergency injury, illness, or condition; sometimes chronic; that can be treated in a non-emergency setting and not necessarily on the same day they are seen in the EMS Department. The CPT Code is 99281 (single problem with straightforward medical decision making). Includes admissions.

² Urgent EMS Visits = a visit by a patient with an acute injury or illness where loss of life or limb is not an immediate threat to his/her well being, or by a patient who needs a timely evaluation (fracture or laceration). The CPT Code for this level of service is 99282 (low complexity) or 99283 (low to moderate complexity). Includes admissions.

³ Critical EMS Visits = a visit by a patient with an acute injury or illness that could result in permanent damage, injury or death (head injury, vehicular accident, a shooting). The CPT Code for this level of service is 99284 (no immediate significant threat to life) or 99285 (immediate threat to life). Includes admissions.

⁴ Total is for hospitals with Emergency Rooms only.
Table 5-2 shows the OSHPD number of Emergency Medical Service (EMS) visits for California and San Luis Obispo County hospitals in 2009, including the number of EMS visits that resulted in hospital admissions. The definitions of the categorizations of non-urgent, urgent, and critical are provided at the bottom of the table.

Data Sources:

- American Association of Colleges of Nursing: http://www.aacn.nehe.edu/Media/FactSheets/NursingShortage.htm
Prenatal Care

Definition: Prenatal care is defined as pregnancy-related health care services provided to a woman between conception and delivery. The two measures assessed for prenatal care include:

- Percentage of live born infants whose mothers received prenatal care in the first trimester of pregnancy.
- Percentage of live born infants whose mothers received adequate or “adequate plus” prenatal care as defined by the APNCU Index.

The Adequacy of Prenatal Care Utilization (APNCU) Index measures two dimensions of care: the adequacy of initiation of care and the adequacy of the use of prenatal services once care has begun (by comparing actual use to the recommended number of visits based on the month of initiation of care and the length of pregnancy). These dimensions are combined to classify each woman’s prenatal care history as inadequate, intermediate, adequate, or adequate-plus.

Importance: The use of timely, high-quality prenatal care can help to prevent poor birth outcomes, especially by identifying women who are at high risk and by providing counseling to mitigate risks such as the use of alcohol, tobacco, and other drugs.

- The American College of Obstetricians and Gynecologists recommends at least 13 prenatal visits in a normal 9-month pregnancy: one each month for the first 28 weeks of pregnancy, one every 2 weeks until 36 weeks, and then weekly until birth.
- The California Department of Public Health reports that during 2005-2007, the average overall percent of pregnant women beginning prenatal care in the first trimester was 85.1%. This indicator has been steadily increasing since 1990 for all population groups, but racial and ethnic minorities remain less likely than whites to enter care early and to receive adequate care.

National Objectives: Two national objectives (Healthy People 2010) related to prenatal care are:

- Increase to at least 90 percent the proportion of all pregnant women who begin care in the first trimester of pregnancy.
- Increase to at least 90 percent the proportion of all live-born infants whose mothers receive prenatal care that is adequate or more than adequate according to the APNCU Index.

Key Findings: Timely Prenatal Care: As shown in Figure 6-1, from 2000-2007, the percentage of all live-born infants whose mothers began prenatal care during their first trimester is lower in San Luis Obispo County than statewide.
During 2006-2008, San Luis Obispo ranked 24\textsuperscript{th} out of 58 counties for mothers who obtained prenatal care in their first trimester (i.e., 20 counties in California had a higher percentage of live-born infants whose mothers obtained prenatal care in their first trimester). This ranking is down from 21\textsuperscript{st} for 2005-2007.

**Adequate Prenatal Care:** As shown in Figure 6-2, from 1991-2009, the percentage of all live-born infants whose mothers received prenatal care that was adequate or more than adequate:

- Has improved, although the national objective of 90\% has not been achieved.
- Has been higher for San Luis Obispo County residents compared to the State of California.
- During 2007-2009, San Luis Obispo ranked 7\textsuperscript{th} out of 58 counties (i.e., 6 counties in California had a higher percentage of live-born infants whose mothers received adequate or better than adequate prenatal care). This is up from 8\textsuperscript{th} in 2005-2007.

**Figure 6-1: Timely Prenatal Care: First Trimester California and San Luis Obispo County, 1991 - 2008**

</tr>
</tbody>
</table>

\*Percent refers to percent of liveborn infants whose moms began prenatal care in their 1st trimester. Data source: County Health Status Profiles, California Department of Public Health, Center for Health Statistics.
Primary Prevention Activities:

- Providing education regarding the importance of beginning prenatal care in the first trimester of pregnancy, and receiving at least 13 prenatal visits during a full-term pregnancy.
- Ensuring that all pregnant women have access to prenatal care that they can afford.
- Providing prenatal services that are culturally acceptable for hard-to-reach populations.

Cost Analysis:

Investing in prenatal care is cost effective, as every $1 spent on prenatal care can save on hospital bills, birth complications, and low birth-weight babies. Estimates on savings range from $3.33\(^1\) saved for each dollar invested to $7\(^2\)

Data Sources:

Data sources for this report include:

- California Department of Public Health, Center for Health Statistics, County Health Status Profiles, available at: [http://www.dhs.ca.gov/hisp/chs/OHIR/Publication/publicationindex.htm](http://www.dhs.ca.gov/hisp/chs/OHIR/Publication/publicationindex.htm)

---

Births

Definition:  

- **Birth rate**: the number of live births per 1,000 total population.  
- **General Fertility rate**: the number of live births per 1,000 women of child bearing ages (15-44).  
- **Distribution of births by race/ethnicity**: the proportion of total live births for selected race/ethnic groups.

Importance:  

According to the Department of Health and Human Services:

- Half of all pregnancies in the United States are unintended.  
- With an unwanted pregnancy, the mother is less likely to seek prenatal care in the first trimester and more likely not to obtain prenatal care at all. She is less likely to breastfeed and more likely to expose the fetus to harmful substances such as tobacco or alcohol.  
- The child of an unwanted pregnancy is at greater risk of being low birthweight, dying in its first year, being abused, and not receiving sufficient resources for healthy development.  
- A disproportionate share of the women bearing children whose conception was unintended are unmarried or at either end of the reproductive age span, factors that in themselves carry increased medical and social burdens for children and their parents.

National Objective:  

There is no national objective specific to general births; however, the Healthy People 2010 goal for Family Planning is “every pregnancy in the United States should be intended.”

Key Findings:  

Previously, statistics on the Birth Rate had been reported, however, due to the population characteristics of San Luis Obispo County (i.e., a larger proportion of elder residents of non-childbearing age), only the General Fertility Rate will be shown.

**General Fertility Rate**: As shown in Figure 7-1, the rate of live births per 1,000 women of childbearing ages has generally been declining for both California and San Luis Obispo County residents since 1995. There has been a slight increase in the General Fertility Rate since 2003, however the county rate has remained lower than the state rate each year and has again begun to decrease statewide and within the county.

**Distribution of births by race/ethnicity**: As shown in Figures 7-2 and 7-3, between 2000 and 2009, the fertility rate among San Luis Obispo County residents has been lower compared to that of other Californians for both non-Hispanic Whites and Hispanics, but the margin of difference has decreased in recent years. The fertility rate for Hispanics in San Luis Obispo County is higher than the fertility rate for non-Hispanic Whites.

Data source: California Department of Public Health, Center for Health Statistics, Vital Statistics Section.

Payment for Delivery: Over 40% of births to residents of San Luis Obispo County are covered by Medi-Cal (California’s publicly funded Medicaid program). As shown in Figure 7-4, approximately 55% are paid for through prepaid health plans or private insurance.

Figure 7-4: Payment Source for Delivery of Infants
San Luis Obispo County Residents, 2009

- Private Insurance: 54.7%
- Medi-Cal/Other: 42.1%
- Other/Unknown: 2.1%
- Self-Pay: 1.1%

Primary Prevention: Primary prevention activities for unplanned pregnancies include providing education regarding sexual responsibility, pregnancy, and contraceptives, and encouraging family planning.

Cost Analysis: According to the Department of Health and Human Services, unintended pregnancies in the United States are serious and costly. Socially, the costs can be measured in unintended births, reduced educational attainment and employment opportunity, increased welfare dependency, and increased potential for child abuse and neglect. For Medi-Cal care alone, national expenditures for unintended pregnancy totals billions of dollars annually. It has been estimated that the pregnancy cost for each woman who does not intend to be pregnant, yet is sexually active and uses no contraception, is about $3,200 annually.

Data Sources: 
- Cost data are from Healthy People 2010, U.S. DHHS.
Breastfeeding

Definition: Breastfeeding initiation during early postpartum: includes exclusively breastfed infants and combination breastfed and formula fed infants at hospital prior to discharge home.

Breastfeeding at six months and one year: breastfed infants and combination breastfed and formula fed infants after discharge home at six months and one year of age.

Importance: The World Health Organization, The American Academy of Pediatrics (AAP), the American College of Obstetrics and Gynecology (ACOG), and the United States Preventive Services Task Force all recommend exclusive breastfeeding for the first six months of life, with exceptions as listed below. In addition, the AAP, the ACOG, the American Academy of Family Physicians, and American Public Health Association recommend that most infants breastfeed for at least 12 months.

According to the Department of Health and Human Services:

- Breast milk is widely acknowledged to be the most complete form of nutrition for infants, with a range of benefits for infants’ health, growth, immunity, and development.
- Benefits of breastfeeding include decreased rates of Sudden Infant Death Syndrome (SIDS), childhood obesity, leukemia, decreased new cases or severity of diarrhea, respiratory infections, and ear infections, among others, and reduced cost to the family.
- Breastfeeding has been shown to improve maternal health, with demonstrated effects, including reduction in postpartum bleeding, earlier return to pre-pregnancy weight, reduced risk of pre-menopausal breast cancer, and reduced risk of osteoporosis, continuing long after the postpartum period.
- Universal breastfeeding is not recommended in the United States. Women who use illicit drugs, who have active, untreated tuberculosis, or who test positive for Human Immunodeficiency Virus (HIV), as well as those who use certain prescribed drugs, should not breastfeed.
- Breastfeeding rates are about 50% lower among African American children compared to white children, and compared with middle- and upper-income families, children in low-income families are less likely to be breastfed.

National Objective: Increase the proportion of mothers who exclusively breastfeed their babies:

- In early postpartum period to 75%.
- At six months to 50%.
- At one year to 25%.
Key Findings: Key findings for breastfeeding initiation, as shown in Figure 8-1, include:

- The number of mothers initiating breastfeeding in infants was higher in San Luis Obispo County compared to the state of California. This difference was statistically significant.
- During 2008-2009, San Luis Obispo County ranked 10th among California’s 58 counties for breastfeeding (i.e., only 9 counties had a higher rate).
- Both the state and SLO County have achieved the Healthy People national objectives for 2010 regarding postpartum breastfeeding.
- The number of breastfed infants per 100 hospital births has increased from 1999 to 2009.

Between July 2008-June 2009, 74.9% of the post delivery women enrolled in the Women, Infant and Children (WIC) program were breastfeeding their infants. Of these women approximately 59% were exclusively breastfeeding and 41% were combination feeding (breast milk + formula). These data, however, may not be representative of all infants in San Luis Obispo County.

Figure 8-1: Breastfeeding Initiation
California and San Luis Obispo County 1999-2009

Data Source: California Department of Public Health, Center for Health Statistics
Primary Prevention: To increase breastfeeding rates among those at highest risk, recommendations from the Department of Health and Human Services include:

- Education of new mothers and their partners
- Education of health providers
- Changes in routine maternity ward practices
- Social support, including support from employers
- Greater media portrayal of breastfeeding as the normal method of infant feeding

Data Sources: Data sources for this report include:

- California Department of Public Health, Center for Health Statistics, County Health Status Profiles 2003-2010; available at: http://www.cdph.ca.gov/programs/OHIR/Pages/default.aspx
- San Luis Obispo County Public Health Department Women, Infants and Children (WIC) data.
Teen Births

Definition: Teen births are the number of live births per 1,000 adolescent female residents by age of delivery for age categories of (a) less than 15 years, (b) 15 to 17 years of age, and (c) 18 to 19 years of age by the specified year(s).

Importance: According to the Department of Health and Human Services:
- There are many problems and challenges associated with unwanted pregnancies. For teenagers, the problems associated with unintended pregnancy are compounded and their consequences are well documented: reduced educational attainment, fewer employment opportunities, increased likelihood of welfare dependency, and poorer health and developmental outcomes.
- Teenage mothers are also less likely to get married or stay married, less likely to complete high school or college, and more likely to live in poverty than their non-pregnant counterparts.
- Infants born to teenage mothers, especially under age 15, are more likely to suffer from low birthweight, neonatal mortality, and sudden infant death syndrome; and they may be at greater risk of child abuse, neglect, and behavioral and educational problems at later stages.
- The California Department of Finance estimates a 23% decrease in annual teen births between 2003 and 2008.

National Objective: The Healthy People 2010 objective related to teen pregnancies is to reduce pregnancies among females aged 15-17 to no more than 45 per 1,000 adolescents.

Key Findings:

Less than 15 years: In San Luis Obispo County, the number of teen births has ranged between 1 and 6 each year from 1993 through 2009. Birth rates for this age group have not been calculated, since they would be unreliable and a comparison with state rates would not be valid. The statewide birth rate among teen females ages 15 and younger has been declining from 1992 to 2009.

15–19 years: The age-specific teen birth rates for the 15-17 and 18-19 year age groups are summarized in Figures 9-1 and 9-2, respectively. The teen birth rate in San Luis Obispo County has been consistently lower than the state. State rates and had been declining for both age groups. In 2009, teen birth rates throughout the State and in SLO County reached a record low. SLO County rates have generally been declining for 15-17 year olds, as well as for 18-19 year olds. San Luis Obispo County has met the Health People 2010 objective related to pregnancies.

During 2006-2008, San Luis Obispo ranked 10th out of 58 counties (i.e., 9 counties had a lower teen birth rate than San Luis Obispo) for birth rates among the 15-19 year age group (per the California Department of Public Health County Health Status Profiles 2010). This is unchanged from the period 2005-2007.
Figure 9-1: Teen Births (15 - 17 Years of Age)
San Luis Obispo County and California, 1998 - 2009

Figure 9-2: Teen Births (18 - 19 Years of Age)
San Luis Obispo County and California, 1998 - 2009

Community Resources: The Public Health Department works with a variety of community organizations, all of which offer activities to increase youth abstinence and provide pregnancy prevention:

- Young men’s club
- Adolescent Family Life Program (AFLP)
- Special teen clinics in high-risk areas
- Family Planning
- Emergency contraception

Data Sources: Data sources for this report include:

- California Department of Public Health, Center for Health Statistics, Office of Health Information and Research. Data available from website: [http://www.applications.dhs.ca.gov/vsq/default.asp](http://www.applications.dhs.ca.gov/vsq/default.asp)
- County Health Status Profiles 2009, Teen Birth Rates (California Department of Public Health: Birth Statistical Master Files, 1998-2009.)
- Cost data were obtained from the website for responsible parenting, facts and statistics: [http://www.responsibleparenting.org/teen.html](http://www.responsibleparenting.org/teen.html), 2000.
**Low Birthweight**

**Definition:**

- **Low Birthweight**: Proportion (percent) of live-born infants who are of low birthweight (under 2,500 grams or 5.5 pounds).
- **Very Low Birthweight**: Proportion (percent) of live-born infants who are of very low birthweight (under 1,500 grams or 3.3 pounds).

**Importance:**

According to the Department of Health and Human Services:

- Low birthweight babies are at a significantly greater risk of death and long-term disabilities such as cerebral palsy, autism (in girls), mental retardation, vision and hearing impairments, and other developmental disabilities.
- Despite their low prevalence, expenditures for the care of low birthweight infants total more than half of the costs incurred for all newborns.
- Some of the major risk factors for low birthweight babies include the use of alcohol and tobacco during pregnancy, low pre-pregnancy weight, and low pregnancy weight gain.
- The highest incidence (13.5%) of low birthweight babies are born to mothers under the age of 15 years.
- African-American babies are twice as likely to be very low birthweight than Caucasian babies.
- Over half of twins and other multiple birth babies have a very low birthweight.

**National Objectives:**

The Healthy People national objectives for 2010 are to:

- Reduce low birthweight incidence to no more than 5 percent of all live births.
- Reduce very low birthweight to no more than 1 percent of live births.

**Key Findings:**

Some of the key findings reveal:

- San Luis Obispo County has consistently had a lower percentage of low birthweight infants compared to the state from 1994-2009, as shown in Figure 10-1. The gap is lessening as San Luis Obispo's percentage increases gradually.
- San Luis Obispo County ranked 25th out of the 58 California counties (i.e., 24 counties had a lower percentage of low birthweight infants born to residents compared to San Luis Obispo County) during 2006-2008.
- Since 1995, SLO County has failed to meet the Healthy People 2010 low birthrate goal.
- The average percentage of very low birthweight infants (less than 1,500 grams at birth) in San Luis Obispo County has remained consistently between 0.9 and 1.1. The numbers are almost the same statewide.
Primary Prevention Activities:

Several Family Health Services programs strive to enhance prenatal nutrition, decrease tobacco use, and encourage early entrance into prenatal care in order to improve the health of the mothers and decrease the rate of low birthweight infants. Primary prevention activities include:

- Reducing the incidence of unintended pregnancies through abstinence and contraceptive education.
- Increasing education about the risks to the fetus if the mother maintains harmful behaviors before and during pregnancy, such as smoking, substance abuse, and poor nutrition.
- Ensuring that smoking cessation services and other substance abuse treatment is available to all pregnant women.
- Increasing access to prenatal care and promoting its importance.
- Implementation of the 4P's Plus program Countywide to assess all pregnant women for the use of substances (alcohol, drugs) during pregnancy, then providing support services and education.
Cost Analysis: Costs for babies who are born too small and need specialized care in a neonatal intensive care unit range from $1,000 to more than $3,000 per day. The length of stay in the neonatal intensive care unit may be lengthy, especially if there are complications. The average lifetime costs for one premature baby are conservatively estimated at $500,000. Low birthweight accounts for 10 percent of all health-care costs for children. Investing in prenatal care is cost effective as every $1 spent on prenatal care can save approximately $3.33 on hospital bills, birth complications, and low birthweight babies.

Data Sources:

- California Department of Public Health, Center for Health Statistics, County Health Status Profiles, available at: http://www.dhs.ca.gov/hisp/chs/OHIR/Publication/publicationindex.htm
- Cost data: March of Dimes website: http://www.modimes.org/
Infant Mortality

Definition: Infant mortality is the number of infant deaths at less than 365 days of age per 1,000 live births. The birth cohort infant death rate is based upon births during a calendar year.

Importance: According to the Department of Health and Human Services:

- Infant mortality is an important indicator of a nation's health and is a worldwide indicator of health status and social well-being. According to the National Center for Health Statistics, as of 2005, the U.S. ranked 30 out of 226 for its infant mortality rate, meaning that 29 countries have lower infant mortality rates than the U.S.
- In the past decade, a critical measure of increased risk for infant death, incidence of pre-term births, has increased. The percentage of pre-term births has risen 36% since 1984. 1 in 8 infants in the U.S. were born pre-term in 2005.
- In 2005, 68.6% of all infant deaths occurred to pre-term infants, up from 65.6% in 2000.
- The disparity in infant mortality rates between whites and specific ethnic groups (African Americans, American Indian/Alaska Natives, Native Hawaiians, and Puerto Ricans) persists. The rate for African Americans is more than twice the national average.
- The impact of preterm-related infant mortality is high for all racial and ethnic groups, but some groups are disproportionately affected. Nearly half (46%) of infant deaths to non-Hispanic black women and 41% of infant deaths to Puerto Rican women were preterm-related, compared to 32% for non-Hispanic white women.

National Objective: The Healthy People national objective for 2010 is to reduce infant mortality to a rate of no more than 4.5 deaths per 1,000 live births. San Luis Obispo County's most recent rate of 4.4 (which is statistically unreliable) just barely meets the national Healthy People 2010 objective.

Key Findings:

- Between 1990 and 2008, San Luis Obispo County had a lower infant mortality rate compared to California, as shown in Figure 11-1. However, starting in 2004-2006, San Luis Obispo’s rate has climbed, and remained high in 2006-2008. These numbers are however, statistically unstable due to the low number of occurrences.
- San Luis Obispo County achieved the national Healthy People 2000 objective of no more than 7 infant deaths per 1,000 live births and continues to work toward meeting the 2010 objective of less than 4.5 infant deaths per 1,000 live births.
- The United States’ infant mortality rate has declined significantly since
1900, when the rate was approximately 100 per 1,000 live births (1 in 10). The United States’ rate has remained fairly stable since 2000 at approximately 6.9 per 1,000 live births.

- The United States’ rate in 2000 was 6.89 per 1,000 live births. In 2008, the rate was 6.9 per 1,000 live births.
- Rates of death by race for infants in the County are all statistically unreliable due to small numbers. As a result, it is impossible to evaluate the impact of race on infant mortality in San Luis Obispo County.

![Figure 11-1: Infant Mortality](image)

Data source: County Health Status Profiles, California Department of Public Health Center for Health Statistics, 2010.

**Primary Prevention Activities:**

- Promoting early prenatal care and initiation of regular visits during pregnancy.
- Encouraging abstinence from tobacco (and second-hand smoke), alcohol and other drugs (including medications that may be harmful to the fetus or infant).
- Educating parents to put infants to sleep on their backs in order to prevent SIDS.
- Teaching proper use of child passenger safety seats to decrease risk of death or serious injury during motor vehicle collisions.

**Cost Analysis:**

The impact of infant mortality on family, friends, and society is not measurable.
Specific cost data is not available.

Data Sources: Data sources for this report include:
- California Department of Public Health, Center for Health Statistics, County Health Status Profile; available at: [http://www.dhs.ca.gov/hisp/chs/OHIR/publicationindex.htm](http://www.dhs.ca.gov/hisp/chs/OHIR/publicationindex.htm)
- World Factbook Infant Mortality Rate Ranking; available at: [http://www.cdc.gov/omh/AMH/factsheets/infant.htm](http://www.cdc.gov/omh/AMH/factsheets/infant.htm)
- Leading Causes of Infant Death, CDC, National Center for Health Statistics; available at: [http://www.cdc.gov/nchs/data](http://www.cdc.gov/nchs/data)
**Definition:**

Vaccines are biological substances used to stimulate the development of antibodies and thus confer active immunity against specific diseases. The proportion of children whose vaccinations are current are provided in this report for the following two categories:

- (a) Children (ages two to 4 yrs-11 months) enrolled in child care programs
- (b) Children in kindergarten

**Importance:**

According to the Department of Health and Human Services, vaccines can prevent debilitating and, in some cases, fatal effects of infectious diseases. The organisms that cause diseases such as polio, measles, and rubella have not disappeared. Rather, they have receded and will reemerge if the vaccination coverage drops. Vaccines protect more than the vaccinated individual; they protect society as well. When vaccination levels in a community are at least 90%, the few who cannot be vaccinated, such as young children and persons with contraindications to vaccinations, often are indirectly protected because of herd immunity (i.e., high levels of vaccination in the population help limit the spread of the disease).

**National Objective:**

Healthy People 2010 objectives related to childhood vaccinations include:

- Goal 14-22: Achieve and maintain effective vaccination coverage levels of at least 90 percent for all universally recommended vaccines among young children (aged 19 to 35 months) 4 DTaP, 3 Polio, 1 MMR, 3 HepB, 3 Hib, 1 Varicella.
- Goal 14-23a-h: Maintain vaccination coverage levels of at least 95 percent for children in licensed day care facilities, and children in kindergarten, through the first grade. Targets only DTaP, Polio, & MMR.

**Key Findings:**

- **Childcare Programs**
  - The percentage of 2 year to 4 year-11 month old children enrolled in child care programs in SLO County with all required vaccinations was slightly higher in 2009 (92.62%) than in 2008 (90.92%).
  - San Luis Obispo met the Healthy People 2010 Goal of 90% coverage for DTaP, Polio, MMR, Hep B, Hib, and Varicella.
  - Conditional entrants went down from 5.06% in 2008 to 4.48% in 2009; meaning fewer children were behind in their vaccination schedule when they started attending childcare.
  - Personal Beliefs Exemption went up slightly from 3.58% in 2008 to 3.92% in 2009, a 1.8% increase since 2007; signifying that some parents continue to be resistant to the benefits of immunizations.
  - The Fall 2009 immunization results for child care programs are summarized below in Table 12-1.

### Key Findings (continued):

#### Kindergarten Students:

- Between the years 2008 and 2009 the percentage of kindergarten students with all required vaccinations dropped 0.6% (from 91.7% to 91.1%) statewide and by 0.8% (from 89.6% to 88.8%) in San Luis Obispo County.
- The County fell below the Healthy People 2010 Goal of 95% coverage for all three vaccines: DTaP, Polio and MMR.
- In Fall 2009, the percentage of San Luis Obispo County Kindergarten students with Personal Belief Exemptions decreased slightly from 4.30% in 2008 to 3.92% in 2009.
- See Table 12-2 for a summary of the immunization results for kindergarten students.

Key Findings (continued):

Exemptions Due to Medical or Personal Beliefs:
California’s School Immunization Law allows exemptions for personal or medical reasons; however, when there is a disease circulating in the community, non-immunized/exempt children can be at risk from other children as well pose a risk to other children. A study in 2000 (JAMA, Vol. 284, No. 24, p. 3145) found that children with Personal Belief Exemptions in child care and primary school were 62 times more likely to get measles and 16 times more likely to catch pertussis than immunized children. Parents considering a personal beliefs exemption for their child need to be aware of both the personal and community risks of exemption.

Primary Prevention Activities:

- Using the California Immunization Registry (CAIR) to generate reminders for parents to keep children up to date on immunizations.
- Encouraging medical providers to offer all vaccinations to children, and provide appropriate education/discussion to parents who refuse/delay vaccinations.
- All school districts in SLO County are on the CAIR. Private schools and childcare centers have also been joining CAIR. This provides immediate access to children’s vaccine status if conditionally enrolled.
- Encouraging parents to always bring their child’s yellow immunization card to any doctor or clinic visit.
- Continuing to provide low-cost vaccines to all children at the Public Health Department, waiving fees when there is an inability to pay.
- Providing provider education on immunizations through the quarterly SLO Public Health Bulletin, regional trainings, provider email
notifications, and the monthly School Nurse meeting.

**Cost Analysis:**

According to Archives of Pediatrics & Adolescent Medicine December 2005, Economic Evaluation of the 7 Vaccine Routine Childhood Immunization Schedule in the US, 2001 reports “Direct and societal benefit-cost ratios for routine childhood vaccinations were 5.3 and 16.5, respectively.” “Regardless of the perspective, the current routine childhood immunization schedule results in substantial cost savings”.

**Data Sources:**

- Fall 2010 Child Care Center and Kindergarten Student Immunization Assessments, California Department of Public Health, Immunization Branch
- Healthy People 2010 Objectives, U.S. Department of Health and Human Services, Office of Public Health and Science; available at:
Communicable Disease Overview

Overview: Communicable (infectious) disease control is one of the core functions of public health departments. Communicable disease services include education, prevention, surveillance, early diagnosis and treatment. Examples of communicable diseases include those transmitted from human to human, from vectors (e.g., infected ticks or mosquitoes) to humans, and from contaminated food or water to humans.

An overview of communicable diseases (and other diseases and health topics) can be found on the Centers for Disease Control and Prevention website, located at http://www.cdc.gov, under the Health Topics A-Z. In addition to general information, there are links to technical documents, such as the Morbidity and Mortality Weekly Report (MMWR) and other websites that provide more detailed information.

Reporting: Timely reporting is crucial to the effectiveness of communicable disease control and prevention. California State law (California Code of Regulations (CCR), Title 17, Section 2500) requires health care providers and laboratories (CCR, Title 17, Section 2505), to report selected diseases and conditions to their local public health department. The confidentiality of patient information is protected. Some communicable diseases, such as pneumonia and influenza, do not have mandatory reporting requirements; however, death and hospitalization data for these two diseases are available. Other diseases, such as chicken pox are only required to be reported when hospitalization is necessary.

Key Findings: Table 13-1 contains a summary of selected communicable diseases reported to San Luis Obispo County Health Department between 1999 and 2010 for residents (including those in institutional facilities). There may be differences between local and state data summaries if there were delays in reporting or if a disease was reclassified after initial reporting. The most frequently reported communicable diseases in San Luis Obispo County during the specified time period were:

- **Sexually Transmitted Diseases**: Chlamydia and Gonorrhea
- **Hepatitis**: Hepatitis C (chronic) and Hepatitis B (chronic)
- **Intestinal Infections**: Campylobacteriosis, Giardiasis, Salmonellosis, Shigellosis and Campylobacteriosis
- **Meningitis and Related Conditions**: Viral Meningitis
- **Other Diseases**: Coccidioidomycosis (Valley Fever), Acquired Immunodeficiency Syndrome (AIDS), Tuberculosis and Pertussis (Whooping Cough)

See more details about AIDS, sexually transmitted diseases, Hepatitis A/B/C, tuberculosis, pneumonia and influenza in other designated chapter(s) within this Community Health Status Report.

Data source: San Luis Obispo County Health Dept., Public Health Dept., except Tuberculosis data from California DHS. Note that the large number of Hepatitis C (Chronic) cases reported in 2002, 2008, 2009 were partially due to late reporting by one institution. Some cases were from prior years.

*HIV was not consistently reported prior to 2007, so no data is available for prior years
Definition:

Human Immunodeficiency Virus (HIV) is the virus that causes Acquired Immune Deficiency Syndrome (AIDS). AIDS is considered to be the advanced form of HIV and occurs when people with HIV develop certain infections due to their weakened immune system or when their CD4+ cell count drops below 200 (the CD4+ cell is an immune system cell involved in protecting against viral, fungal, and protozoal infections).

In 2006, California passed Senate bill 699 requiring physicians to report all new HIV positive test results using names instead of unique identifiers as was previously established for persons with HIV. While this now allows consistent tracking of HIV, all previously reported data is considered unreliable.

Importance:

According to the Joint United Nations Programme on HIV/AIDS, in 2010, the following trends (worldwide) were evident:

- 33.3 million people were estimated to be living with HIV/AIDS.
- During 2009, AIDS caused the deaths of an estimated 1.8 million people, including 260,000 children under the age of 15.
- An estimated 2.6 million people worldwide were newly infected with HIV in 2009, including 370,000 children.

According to the Centers for Disease Control and Prevention:

- An estimated one million persons are believed to be living with HIV in the US as of 2010. One in five (21%) of those people are unaware of their infection.

According to the Department of Health and Human Services:

- Currently, HIV/AIDS has been reported in virtually every racial and ethnic population, every age group, and every socioeconomic group in every State and most large cities in the United States.
- Recently introduced therapies for HIV/AIDS have reduced illness, disability, and death due to AIDS; however, access to care may limit progress in this area.
- There is no cure for HIV, and the current treatments are difficult to take because of a complicated dosing schedule, severe side effects and long term complications.
- Most transmission of HIV in the United States is among sexual partners of people with HIV and/or people who share needle-injecting equipment that has been contaminated with HIV.
- A disproportionate percentage of HIV and AIDS cases occur among ethnic minorities, especially Hispanics and African Americans.
- Data indicates that as Sexually Transmitted Disease (STD) rates increase, HIV rates also increase. STDs can increase the risks for HIV transmission.

National Objective:

The goals of the Department of Health and Human Services in the prevention of HIV transmission are to ensure that high risk individuals know their HIV status, to preserve the status of those uninfected with HIV making certain that those with HIV do not transmit it to others, and to make sure that those infected with HIV have...
access to appropriate therapies. Healthy People Objectives include:
- Reduce the number of deaths attributed to HIV infection to 0.7 deaths per 100,000 people.
- Reduce new AIDS cases among teens and adults to 1 new case per 100,000 people.

**Key Findings:**

The key findings for HIV/AIDS include:
- As shown in Figure 14-1, the crude rate for AIDS incidence has generally decreased for California, as well as the San Luis Obispo County, since the period 1994-1996.
- As shown in Figure 14-2, the incidence of AIDS cases among county institution residents (California Men’s Colony, Atascadero State Hospital, and the California Youth Authority) has decreased in relation to that of the general population. The incidence of community AIDS cases rose in 2009 after several years of decline.
- As shown in Figure 14-3, the number of AIDS deaths has declined significantly since 1999, due to the introduction of Highly Active Anti-Viral Therapy (HAART) in 1994.
- A California law, Senate bill 699, passed on April 17, 2006 requiring providers to report all new HIV positive test results by name instead of by coded identifiers as was previously established. This will eventually provide a better picture of HIV rates state- and countywide.
- As shown in Figure 14-4, females in our county usually contracted HIV through injection drug use and heterosexual contact while men usually contracted HIV from male-to-male sexual contact or male-to-male sexual contact coupled with injection drug use.

---

After 2009, data does not include SLO County cases that were in another county when they died.

![Bar chart showing AIDS deaths by year and setting, from 1999 to 2009.](chart2)
Primary Prevention Activities:

- Implementing prevention programs aimed at decreasing high-risk behaviors such as multiple partners, unprotected sex, drug use, etc.
- Educating groups with a high prevalence or increasing prevalence of HIV infection such as African Americans, Hispanics, women and men who have sex with men.
- Encouraging pregnant women and healthcare providers to test for HIV and including information about how to reduce the risk of transmitting HIV to newborns.
- Promoting needle exchange programs, drug rehabilitation and counseling for at-risk drug users.
- Taking steps to decrease transmission of STDs overall to reduce risk of transmitting HIV.
- Testing people who may be unaware of possible infection and referring them to medical care, counseling, health education, and transmission risk reduction services.

Cost Analysis:

The latest estimates indicate that as of the end of 2006, 1,106,400 people in the United States were infected with HIV, with approximately 56,300 new infections that year. According to the California Department of Public Health, the lifetime costs of health care associated with HIV can range from $71,143 (for low end care) to $424,763 (for high-end care). HIV prevention efforts are very cost-effective in the face of such high costs for care for persons infected. Prevention efforts include availability of culturally and linguistically appropriate HIV counseling and testing, partner counseling, and referral systems for individuals at high risk for HIV infection.

According to the Congressional Research Services Report for Congress, in Fiscal Year 2004, total United States federal HIV/AIDS spending was estimated to be $18.5 billion. These costs were divided among care and assistance (63%),
research (16%), prevention (12.0%), and income support programs (9%).

Community Resources: Testing/Prevention: Public Health offers limited HIV antibody testing at Public Health sites in the county. Planned Parenthood, County Drug and Alcohol Services, the Community Action Partnership and the AIDS Support Network provide HIV prevention education to those at risk for contracting HIV.

Services to People with HIV: The AIDS Support Network offers services to people with HIV and their families through the Early Intervention Program, AIDS Drug Assistance Program, Ryan White Emergency Care Act funds and the Housing Opportunities for People with AIDS (HOPWA) Program.

Data Sources: Data sources for this report include:

- Prevention Pays, Centers for Disease Control; available at: http://www.cdc.gov/hiv/resources/reports/comp_hiv_prev/prev_pays.htm
Sexually Transmitted Infections

Definition: A sexually transmitted infection (STI) is an infectious disease transmitted through sexual activity. There are about 25 commonly known organisms that cause STIs. The most common STIs are Chlamydia, Gonorrhea, Genital Herpes, HPV and Syphilis.

Importance: According to the Department of Health and Human Services:

- Despite the fact that STIs are quite preventable, they continue to be an increasingly large public health concern.
- STIs have many long lasting repercussions including decrease in reproductive health, danger to fetal health, perinatal problems and even cancer.
- In many STIs, there are no apparent symptoms, allowing for the disease to be spread unknowingly and leading to long-term health consequences for the infected individual.
- Limited or lack of access to health care along with high-risk sexual activity is many times directly correlated to a larger proportion of STIs amongst certain social groups such as migrant workers, sex workers, incarcerated populations and adolescents.

National Objective: The Department of Health and Human Services seeks to “promote responsible sexual behaviors, strengthen community capacity, and increase access to quality services to prevent sexually transmitted diseases and their complications.” The Healthy People 2010 objectives for the most common STIs are as follows:

- Reduce proportion of males and females aged 15 to 24 infected with chlamydia trachomatis to only 3 percent.
- Reduce gonorrhea to only 19 new cases per 100,000 people.
- Reduce occurrence of primary and secondary syphilis to 0.2 cases per 100,000 people.
- Reduce the percentage of adults between the ages of 20 and 29 infected with genital herpes to only 14 percent.

Key Findings: The key findings for chlamydia, gonorrhea and syphilis include:

- Chlamydia was the most commonly diagnosed STI in San Luis Obispo County in 2010. The rate of reported Chlamydia in San Luis Obispo County, while significantly lower compared to the State, as shown in Figure 15-1, continues to increase, likely in part to increased testing.
- Between 1999 and 2009, the rate of reported gonorrhea in San Luis Obispo County was significantly lower than the State’s, as shown in Figure 15-2. San Luis Obispo County has met the Healthy People objective of no more than 19 new cases per 100,000 people.
- As shown in Figure 15-3, the rate of reported syphilis (primary and secondary) increased markedly in California from 2000 to 2008 but in 2009 began to decrease. An outbreak in a State Institution led to a large increase in cases in 2008 in SLO County.

Data source: State of California, Department of Health Service; Sexually Transmitted Disease
Primary Prevention Activities: Primary prevention activities include:

- Encouraging abstinence as the only way to avoid STIs.
- Providing easy access to health care for the economically and/or socially disadvantaged to allow for increased detection and treatment among high-risk groups.
- Providing comprehensive information about all aspects of STIs in sexual education classes in schools.
- Suggesting that STI screening be conducted for those deemed to be at risk of contracting and/or spreading STIs.
- Distributing information throughout the community, focusing on those individuals at higher risk of contracting STIs and explaining how to reduce the risk of contracting STIs through use of condoms and monogamy.

Community Resources: The Community Action Partnership of San Luis Obispo County, Inc. (formerly the Economic Opportunity Commission, or EOC) Family Planning, Planned Parenthood and the County Public Health Department all offer no cost to low cost birth control and STI information as well as screening for many STIs.

Data Sources: Data sources for this report include:

- California Department of Health Services, Department of Public Health, Sexually Transmitted Disease Control Branch.
Definitions:

Viral hepatitis is caused by infection with any of at least five distinct viruses. The illnesses caused by hepatitis A virus, hepatitis B virus, and hepatitis C virus are all reportable diseases.

- Hepatitis A is a liver disease caused by the hepatitis A virus (HAV). HAV is most commonly spread person-to-person by fecal contamination and oral ingestion. The virus is often spread through food handling by infected individuals. Hepatitis A is the most easily treated of the three strains.

- Hepatitis B is a liver disease caused by the hepatitis B virus (HBV). Hepatitis B can cause lifelong infection, cirrhosis (scarring) of the liver, liver cancer, liver failure, and death. HBV is most commonly transmitted through sexual contact or through blood exposure. HBV can also be transmitted from mother to infant during birth.

- Hepatitis C is a liver disease caused by the hepatitis C virus (HCV). Although detectable in the blood of persons who have the disease, HCV infection tends to have very mild or no symptoms during the acute phase of the disease. In 75-85 percent of the cases, it becomes a chronic infection, which can lead to cirrhosis, liver disease and/or liver failure. HCV is typically spread by blood-to-blood contact between an infected person and an uninfected person.

Importance:

According to the Centers for Disease Control and Prevention:

- In 2007, a case rate of 1.0 per 100,000 of hepatitis A was reported in the United States, the lowest ever recorded. Children have the highest rate of HAV infection in the country.

- The estimated number of new hepatitis B infections per year has declined from an average of 260,000 in the 1980s to about 43,000 in 2007. Rates are highest for males, particularly those aged 25-44 years.

- The most common chronic blood-borne viral disease in the United States is hepatitis C virus (HCV). An estimated 4.1 million (1.6%) Americans have been infected with HCV, of whom 3.2 million are chronically infected.

- Most hepatitis cases occur in young adults who have multiple sexual partners or unprotected sex, intravenous drug users, those who have been incarcerated, and homosexual men.
National Objective: The Healthy People 2010 overall goal is to reduce the number of new cases of hepatitis A, B or C by promoting proven prevention methods. The specific objectives are as follows:

- Reduce new cases of hepatitis A to only 4.5 per 100,000 population.
- Reduce hepatitis B infection in adults (aged 19 to 24) to a rate of 2.4 per 100,000 population and in adults (aged 25 to 39) to a rate of 5.1 per 100,000 population.
- Decrease occurrence of hepatitis C to only 1 new (acute) case per 100,000 population.

Key Findings: The key findings for hepatitis A, B and C include:

- **Hepatitis A, B and C:** The number of reported hepatitis cases is shown in Table 16-1. The majority of the reported hepatitis cases were hepatitis C (chronic). The number of hepatitis C cases increased markedly in 2001 through 2003. The very large increase in 2002 was largely due to late reporting (to the Public Health Department) by one of the institutions, as some of these cases were from prior years. There was also a tremendous increase in 2008. Per the California Department of Health Services, “the apparently increasing trend [in hepatitis C cases] is most likely a function of increased testing and reporting rather than an indication of increasing number of new hepatitis C cases.” The State has provided funding for increased public education and outreach related to hepatitis C. In 2000, the San Luis Obispo County Hepatitis C Project began to provide hepatitis C testing in conjunction with the County’s State-funded HIV testing program. State funding for the PHD HIV/AIDS program was eliminated in 2009, and thus so too was the program, but the SLO Hep C project still provides support services. Since that time, more cases have been identified and reported in the community.

<table>

*Note that the large number of Hepatitis C (Chronic) cases reported in 2002 (n = 1,212) were partially due to late reporting to the Public Health Department by at least one of the institutions. Some of these cases were from prior years. NR = not reportable.*

*Data source: San Luis Obispo County Health Department, Automated Vital Statistics System.*
Key Findings (continued):

- Institutionalized Cases of Hepatitis:
  - The majority (70%) of the ~7,000 hepatitis C cases during 1997–2010 were among institutionalized residents, as shown in Figure 16-1.
  - Roughly half (51%) of the 495 hepatitis B (chronic) cases during 1997-2008 were among institutionalized residents.

![Figure 16-1: Hepatitis C in San Luis Obispo County](image)

Other key findings for hepatitis A and C include:

- **Hepatitis A**: Since 2006, the most frequently reported risk factor for hepatitis A was international travel. The greatest decrease in hepatitis A cases has been among children, due primarily to the 1999 recommendation for childhood vaccination. Since 1998, San Luis Obispo County has met the Healthy People 2010 objective of reducing new cases of hepatitis A to no more than 4.5 per 100,000.

- **Hepatitis C**: In 2008, hepatitis C rates rose dramatically, with Intravenous Drug Use (IDU) as the most commonly identified risk factor for infection. Some, but not all of the high rate in 2008 was due to reporting of cases from prior years not yet recorded. Although San Luis Obispo County continues to report high numbers of chronically infected persons, there appear to be very few newly acquired infections occurring. From National data, the majority of persons infected today with hepatitis C were infected in the 1970s and 1980s.
Primary Prevention Activities:

Potential primary prevention activities include:

- Requiring hepatitis A virus (HAV) vaccination of children in areas with consistently higher levels of HAV infection.
- Promoting vaccination for hepatitis A in high-risk groups including adults traveling to foreign countries, persons in high-risk occupations and those with chronic liver disease.
- Promoting hepatitis B vaccination in children to help protect them when they reach high-risk ages or start to engage in high-risk behavior.
- Increasing levels of vaccine coverage of HBV for high-risk groups by vaccinating in drug treatment clinics, Sexually Transmitted Disease (STD) treatment clinics, correctional facilities and Human Immunodeficiency Virus (HIV) prevention sites.
- Educating adolescents and other high-risk groups of the dangers involved in sharing drug injecting needles and engaging in sexual relations without barrier type protection.
- Educating health care workers of potential risks they are exposed to and possible prevention methods.

Screening pregnant women for hepatitis B virus during an early prenatal visit is essential to identifying those who are infected. Women at high risk should be retested late in pregnancy. In 1997, 14 states had laws or regulations to ensure such screening. To be maximally effective, steps to prevent transmission of HBV to infants born to mothers who are infected must begin as soon as the child is born.

Data Sources:

Data sources for this report include:

- Centers for Disease Control and Prevention, National Center for Infectious Diseases, Division of Viral Hepatitis. Data available from website: http://www.cdc.gov/ncidod/diseases/hepatitis/.
- California Department of Public Health, Center for Health Statistics, County Health Status Profiles; available at: http://www.cdph.ca.gov/programs/OHIR/Pages/default.aspx
- San Luis Obispo County Health Department, Automated Vital Statistics System, Confidential Morbidity Report data.
Definition: Tuberculosis is a serious disease caused by infection with the organism *Mycobacterium tuberculosis* and usually progresses to more severe outcomes among infants, adolescents, and immunosuppressed patients.

Importance: According to the Department of Health and Human Services:

- Cases of tuberculosis increased by 20% between the years of 1985 and 1992. The trend toward eradication of tuberculosis was reversed due to the emergence of multi-drug resistant TB and the HIV/AIDS epidemic.
- Between the years of 1993 and 2009, new reported cases of tuberculosis declined. The steepest decline occurred in 2009, with an 11.3% decrease in cases.
- Patients who do not receive sufficient treatment for tuberculosis run a higher risk of becoming ill and contagious again, and the opportunity for development of new drug-resistant strains increases.

National Objective: The Healthy People 2010 objectives for tuberculosis are:

- Reduce new tuberculosis cases to 1 new case per 100,000 population.
- Increase the percentage of tuberculosis patients to finish curative therapy within 12 months from 74% in 1996 to 90% by 2010.
- Increase the proportion of all TB patients with latent infection who complete curative therapy from 62% in 1997 to 85% in 2010.
- Reduce the average time for laboratories to confirm and report positive tuberculosis tests from 21 days for 75% of tuberculosis cases in 1996 to 2 days for 75% of cases in 2010.

Key Findings: The key findings for tuberculosis include:

- The reported incidence of tuberculosis in San Luis Obispo County has been lower compared to the State of California from 1991 through 2010.
- Although California has consistently had higher rates than the United States since 1991, San Luis Obispo County’s rates have been lower than the United States rates since 1995.
- In 2008 San Luis Obispo achieved the Healthy People 2010 objective of reducing new tuberculosis cases to 1 new case per 100,000 population. The goal has not been met in 2009 or 2010.

Primary Prevention Activities: Primary prevention activities include:

- Targeted screening of those at increased risk of exposure or of likelihood of progressing to active TB disease, e.g., known contacts of a person with infectious TB disease, those who have recently immigrated from countries with high rates of TB, persons with HIV infection or other immunosuppressive conditions.
- Ensuring that those infected with mycobacterium tuberculosis receive the complete course of curative therapy to reduce the spread of the disease, the
chance that the infection will be reactivated in the patient at a later date, or breakouts of new drug resistant strains of the disease.

- Increasing the percentage of those with latent tuberculosis who complete treatment so as to reduce the number of individuals progressing to active disease and thereby becoming capable of spreading it to others.

- Decreasing the amount of time that laboratories take to confirm and report positive tuberculosis tests by upgrading lab facilities, properly training lab employees in new technology and increasing general efficiency of these laboratories.

**Data Sources:** Data sources for this report include:

- California Department of Health Services, Report on Tuberculosis in California, 2006; available at: [http://www.cdph.ca.gov/DATA/STATISTICS/Pages/TuberculosisDiseaseData.aspx](http://www.cdph.ca.gov/DATA/STATISTICS/Pages/TuberculosisDiseaseData.aspx)

- San Luis Obispo County Health Department, Automated Vital Statistics System, Confidential Morbidity Report data.
Importance:

- Pneumonia and influenza (P & I) are important causes of morbidity and mortality in the United States, and together are the eighth leading cause of death in the US. There were an estimated 6,809 deaths in the California in 2008 due to pneumonia and influenza. It was the sixth leading cause of death in California between 2006-2008.

- It is estimated that during most influenza seasons, approximately 5% to 20% of the population is infected with influenza, although rates of infection vary among age groups and from one season to another.

- People considered at high risk for pneumonia and influenza include the elderly, the very young, and those with underlying health problems, such as chronic obstructive pulmonary disease (COPD), diabetes mellitus, and congestive heart failure. Individuals with diseases that impair the immune system, such as AIDS, or patients with chronic illnesses, such as asthma or those undergoing cancer therapy or organ transplantation, are particularly vulnerable. During the H1N1 pandemic, those younger than 65 years were at highest risk of becoming infected with flu, a change from a normal influenza season.

Key Findings

Pneumonia and Influenza Hospitalizations

- During 2006, 1.2 million hospital discharges were due to P & I in the US, with an average stay of 5.1 days. In 2008, in SLO County, 631 patients were admitted to San Luis Obispo County acute care hospitals with a principal diagnosis of influenza or pneumonia. During this same time, there were an average of 22,533 admissions for all causes. The percentage of hospitalizations due to influenza or pneumonia is shown in Figure 18-1. The majority (97.5%) of these individuals were 18 years of age or older, while 2.5% were below the age of 17 years.
Pneumonia and Influenza Deaths
- During 2000-2008, an average of 44 deaths per year occurred in San Luis Obispo County with a primary cause of influenza or pneumonia. During this same time period, an average of 2,067 deaths due to all causes occurred per year; therefore, 2.1% of all deaths were attributed to influenza or pneumonia. The actual number of deaths from influenza or pneumonia per year ranged from 33 to 93, as shown in Figure 18-2.

Note: These are total hospitalizations, not necessarily the total number of individuals hospitalized.
Between 1997-2008, the majority of the individuals who died of pneumonia or influenza in San Luis Obispo County were 65 years of age or older (~91%), while ~6.4% were between the ages of 45 and 64. The percentage below the age of 5 years was 0.7%. The mortality by age group is shown in Figure 18-3.

![Figure 18-3: Influenza and Pneumonia Deaths by Age](image)

**Figure 18-3: Influenza and Pneumonia Deaths by Age**
San Luis Obispo County 1997 - 2007

**National Objectives:**

Healthy People 2010 objectives:

- Increase the proportion of adults who are vaccinated annually against influenza and ever vaccinated against pneumococcal disease to:
  - 90% for institutionalized adults (persons in long-term or nursing homes)
  - 90% for noninstitutionalized adults aged 65 years and older
  - 60% for noninstitutionalized high-risk adults aged 18-64 years

We do not have data to show how San Luis Obispo county is performing, in relation to these national objectives.
Primary Prevention Activities:

Per the Centers for Disease Control and Prevention:
Influenza vaccination is the primary method for preventing influenza and its severe complications. As indicated in this report from the Advisory Committee on Immunization Practices (ACIP), annual influenza vaccination is now recommended for all persons 6 months and older.

Physicians and other healthcare workers who notice an unexpected increase in patients with influenza-like symptoms or pneumonia should report the increase to the Public Health Department.

Data Sources:

Data sources for this report include:

Overview: The leading causes of death changed during the 20th century from infectious to chronic diseases. According to the American Public Health Association, in 1900: pneumonia and influenza, tuberculosis, and gastroenteritis and colitis were the three leading causes of death, accounting for nearly a third of all deaths. Today, heart disease, malignant neoplasms (cancer), and cerebrovascular diseases (strokes) are the three leading causes of death, accounting for almost two-thirds of all deaths.

The 2009 leading causes of death among San Luis Obispo County Residents are shown in Table 19-1. Two-thirds, or 66.67% of the 2009 deaths were due to the three leading causes: heart diseases, cancer, and strokes. In 2009, there were a large number of unintentional injury deaths in San Luis Obispo County.

![Deaths (%) by Age Category](image1)

**Figure 19-2: Age-Adjusted Death Rates (2006-2008)**
San Luis Obispo, California, and Healthy People 2010

![Age-Adjusted Death Rates](image2)

**Data Sources:** California and San Luis Obispo County data from California Department of Health Services, Center for Health Statistics, Cal Health Status 2010. Healthy People 2010 Objectives were not established for chronic lower respiratory disease, Alzheimer's disease, Pneumonia and influenza, and Diabetes. * Unintentional injuries are considered to be those from motor vehicle accidents, poisonings (including accidental drug or alcohol overdoses), falls, pedal cycle accidents, fires, drownings, unintended firearm deaths, and other causes.
National Objectives: The Healthy People 2010 objectives for causes of death are summarized below. There is no objective for pneumonia and influenza deaths, chronic lower respiratory disease deaths (other than chronic obstructive pulmonary disease or asthma by age categories), chronic liver disease deaths (other than to reduce cirrhosis deaths to 3.0 per 100,000 population), or Alzheimer’s disease deaths.

- Reduce coronary heart disease deaths to 166 per 100,000 population
- Reduce overall cancer deaths to 159.9 per 100,000 population
  - Reduce lung cancer deaths to 44.9 per 100,000 population
  - Reduce breast cancer deaths to 22.3 per 100,000 population
- Reduce cerebrovascular disease deaths to 48 per 100,000 population
- Reduce unintentional injury deaths to 17.5 per 100,000 population
- Reduce diabetes death rate to 45 per 100,000 population
- Reduce suicide deaths to 5.0 per 100,000 population

Death Rates: The California leading causes of death are shown in Table 19-2, with a comparison of California and San Luis Obispo County rates. The age-adjusted death rate is shown. Age adjusting the death rates allows for comparing to larger populations if all populations had the same percentage of persons by age breakdown. If one only looks at crude death rates, then San Luis Obispo County has a higher mortality rate (compared to California) for most health status indicators, as one would expect due to our higher percentage of elderly residents. An age-adjusted rate is the hypothetical rate that a group (e.g., our county) would have if its population were distributed in the same proportions as the 2000 United States population.

Summary:
- The San Luis Obispo County 2006-2008 average age-adjusted death rate of 628.0 per 100,000 for all causes of death was lower than the rate for the State of California (666.4).
- The San Luis Obispo County 2006-2008 average age-adjusted death rates for the top two causes of death (cancer, coronary heart disease) were lower compared to the State of California, and met the Healthy People 2010 objectives.
- The San Luis Obispo County 2006-2008 age-adjusted death rates for chronic lower respiratory disease, pneumonia and influenza, diabetes, Alzheimer’s and chronic liver disease / cirrhosis were lower compared to the State of California.
- The 2006-2008 age-adjusted mortality rates due to unintentional injuries and suicides among San Luis Obispo County residents were higher than those of the State of California.

Data Sources: Data sources for this report include:
- California Department of Public Health, Center for Health Statistics: (a) Public Health Information System, (b) County Health Status Profiles 2007 and (c) other CDPH reports specified in Table 19-2. http://www.cdph.ca.gov/programs/OHIR/Pages/default.
**Chronic Diseases**

**Definition:**
According to the American Public Health Association, chronic diseases can be defined as those that have a prolonged course of illness, that do not resolve spontaneously, and for which a complete cure is rarely achieved. They are generally characterized by uncertain etiology (cause), multiple risk factors, and functional impairment or disability. Examples of the most common chronic diseases and a brief definition of each include:

- **Cardiovascular disease** (CVD) refers to a wide variety of blood vessel diseases, including coronary heart disease, hypertension (high blood pressure), cerebrovascular disease (stroke), and rheumatic heart disease. Coronary heart disease, or coronary artery disease, is a term used to identify several disorders that reduce the blood supply to the heart muscle. This is most frequently the result of narrowing of the coronary arteries by atherosclerosis. The most common manifestations of coronary heart disease are angina pectoris (chest pain), myocardial infarction (heart attack), and sudden death.

- **Cancer** refers to many different types of diseases characterized by uncontrolled growth and spread of abnormal cells. The principal danger of a cancer is its tendency to metastasize, or invade neighboring tissues or organs, and to grow in other areas of the body. If this spread remains untreated, cancer cells invade vital organs or cause dysfunction by displacing normal tissue.

- **Chronic lung disease** refers to a diverse group of disorders with varying symptoms, diagnostic criteria, and causative factors. Most of the disorders are accompanied by impairment in lung function. A relatively common diagnosis is “chronic obstructive pulmonary disease”, which includes patients with chronic bronchitis and emphysema, and a subset of patients with asthma.

- **Diabetes** refers to a disease in which the body is unable to sufficiently produce and/or properly use insulin, a hormone needed to convert glucose into energy. If glucose levels are too high, the patient will develop a condition called ketoacidosis, which is fatal without treatment. Genetics, obesity and lack of exercise all appear to play a role in the development of diabetes.

- **Cirrhosis and Other Chronic Liver Diseases** refer to four major categories of liver disease: alcoholic fatty liver, hepatitis, cirrhosis, and other or unspecified forms of liver disease.

- **Arthritis and Other Musculoskeletal Diseases** refer to more than 100 diseases, most of which are uncommon and are of unknown cause. However, two of these disorders make up the vast majority of disability and economic costs: (1) **osteoarthritis**, also known as degenerative joint disease, and (2) **osteoporosis**, a bone disorder in which the reduction of bone tissue occurs to the extent that fractures occur with minimal or trivial trauma. Other conditions include rheumatoid arthritis (an autoimmune disease involving chronic inflammation that begins in the joints) and gout (a metabolic disease characterized by recurrent attacks of acute arthritis, an increase in serum uric acid concentration, and deposition of crystals in and around joints).

- **Chronic Neurological Disorders** refer to a variety of disorders. The most common of these and a brief description are summarized in Table 20-1.
<table>

<td>Two principal headache types are migraine, or vascular headaches, and muscle contraction headaches. There are no uniform case definitions for headache types/classifications.</td>
</tr>
</tbody>
</table>

*Source: Chronic Disease Epidemiological Control, American Public Health Association, 1993.*
Importance:

According to the American Public Health Association:

- **Chronic diseases** are the leading causes of death.
- **Heart disease, cancer, and cerebrovascular diseases (stroke)** account for nearly two-thirds of all deaths.
- **Chronic Obstructive Pulmonary Disease (COPD)** occurs most often in older people. As much as 10 percent of the population aged 65 years and older is estimated to have COPD. Between 80 and 90 percent of COPD is attributable to cigarette smoking.
- **Asthma** is a serious and growing health problem. An estimated 3.7 million adults and 1.7 million children in California have been diagnosed with asthma at one point in their lives. Asthma was responsible for about 150,000 ER visits, 36,000 hospitalizations, 500 deaths, and approximately $770 million in hospitalization costs alone in California in 2007. Yet most of the problems caused by asthma could be averted if persons with asthma and their health care providers managed the disease according to established guidelines.
- **Diabetes** prevalence has increased steadily over the past decade; by 2010, 18.8 million persons in the US had been diagnosed with diabetes, and an additional 7.0 million had undiagnosed diabetes. The CDC estimates that in 2008, 6.0% of adults (age-adjusted rate) in San Luis Obispo County have diagnosed diabetes. Over the past decade, diabetes has remained the seventh leading cause of death in the United States, primarily from diabetes-associated cardiovascular disease. In the United States, diabetes is the leading cause of non-traumatic amputations, blindness among adults aged 20-74; and end-stage renal disease (ESRD).
- **Cirrhosis** is caused primarily by sustained heavy alcohol consumption, and was the 12th leading causes of death in the United States in 2007. Cirrhosis occurs when healthy liver tissue is replaced with scarred tissue until the liver is unable to function effectively. Higher State excise tax rates on distilled spirits are associated with lower death rates from cirrhosis.
- **Arthritis** is the leading cause of disability in the US. Overall, 22% (50 million) of adults reported arthritis in the 2007-2009 National Health Interview Survey. Women have significantly higher age-adjusted rates than men (24.3% vs. 18.3%)
- **Osteoporosis**: Per the U.S. Department of Health and Human Services, about 13 to 18 percent of women aged 50 years and older and 3 to 6 percent of men aged 50 years and older have osteoporosis, a reduction in bone mass or density that leads to deteriorated and fragile bones. The major health consequence of osteoporosis is an increased risk of fractures. Approximately 1.5 million fractures per year are attributed to osteoporosis. By 2020, one in two Americans over age 50 is expected to have or be at risk of developing osteoporosis of the hip. Annual direct care expenditures for osteoporotic fractures are estimated at $12 to $18 billion per year in 2002 dollars.
National Objectives: Healthy People 2010 objectives related to chronic disease deaths are summarized in the Leading Causes of Death chapter.

Key Findings: Consistent with the State of California and the United States, chronic disease illnesses and deaths are a major health care issue for San Luis Obispo County.

- In the Leading Causes of Death chapter, our county age-adjusted death rates were lower among San Luis Obispo County residents compared to that of Californians.
- Chronic disease prevalence data for San Luis Obispo County has been limited until 2001, when the California Health Interview Survey (CHIS), a collaboration of the UCLA Center for Health Policy Research, the California Department of Health Services, and the Public Health Institute, released the results of its 2001 survey. CHIS is a random-digit dial telephone survey of representative households from counties in California. Many CHIS questions are adapted from the National Health Interview Survey, other national and state surveys, and individual research projects that focus on population health.
- As shown in Table 20-2, compared to California, San Luis Obispo County had a slightly higher percentage of the population reporting ever having been diagnosed with heart disease.

Data Source: 2007 California Health Interview Survey

- As shown in Table 20-3, San Luis Obispo County had a lower percentage of persons ever diagnosed with diabetes compared to that of California. Neither California nor San Luis Obispo County have met the Healthy People 2010 objective for diabetes prevalence of no more than 2.5 cases per 100 adult population. However, only five counties and one region have significantly lower rates than the state, and SLO County is one of them according to L.E. Lund’s report “Prevalence of Diabetes in California Counties, 2003 Update.”
- The prevalence of diabetes among children (ages 0 to 17 years) in California was 0.8 per 100 state population. San Luis Obispo County had below the minimum required for reporting.

**Data Source:** California Health Interview Survey 2007:

**Cost Analysis:**
The costs of chronic diseases are enormous, not only in the illnesses, deaths, and economic losses, but also in the negative impact that chronic diseases may have on the quality of life of individuals and their families and friends. Individuals suffering from chronic disease may experience chronic pain, dysfunction and disability, depression, economic hardship, social isolation, and increased risk of life-threatening events. The Institute for Health and Aging, has estimated the number of persons with chronic conditions and their corresponding direct medical costs as follows:
In 2000, 105 million persons affected; $503 billion cost estimate
In 2050, 167 million persons affected; $906 billion cost estimate

Primary Prevention Activities: The goals of chronic disease control are to reduce disease incidence, prevent or delay disability onset, reduce the severity of the disease, and prolong the individual’s life.

Data Sources:
- American Public Health Association, Chronic Disease Epidemiology Control, 1993.
- California Department of Public Health, Center for Health Statistics.
- Centers for Disease Control and Prevention: National Diabetes Surveillance System.
Definitions:

About 443,000 people die prematurely from smoking or secondhand smoke exposure in the United States each year. In 2009, from data in the Behavioral Risk Factor Surveillance System, the CDC estimated that 17.9% of adults in the U.S. were current cigarette smokers, while 12.9% of adults in California were smokers. Men in California were more likely to smoke, with 15.6% of men in California vs. 10.2% of women reporting being current smokers. Since 1964, Surgeon General reports on smoking and health have concluded that tobacco use is the single most avoidable cause of disease, disability and death in the United States. Smokers are not the only party at risk; the persons near by also inhale the toxic smoke—this situation is often called “secondhand smoke.”

People at risk include those who engage in smoking cigarettes as well as those who inhale the carcinogenic and toxic smoke, also known as secondhand smokers. Other people at risk include people who partake in certain activities or who have certain characteristics that increase their potential for contracting an illness, injury, or health problem after exposure to cigarette smoke.

Risk factors are derived by contrasting the frequency of a disease or health condition in persons exposed to a specific trait or risk factor with the frequency in another group not exposed to the same risk factor. Risk factors are generally in one of three major categories: (1) behavioral or lifestyle patterns; (2) environmental factors; and (3) inborn or inherited characteristics.

Health behaviors include lifestyle patterns such as smoking, sedentary lifestyle, alcohol and other drug use that are associated with an increased risk or chance for developing chronic diseases.

Importance:

Tobacco use combined with high blood pressure and poor nutrition is believed to account for approximately 73% of premature deaths in the United States.

According to the United States’ Preventive Services Task Force (Department of Health and Human Services, 2010):

- Smoking alone contributes to one out of every five deaths in the United States.

- Complications from secondhand smoke include:
  - Heart disease
  - Lung cancer
  - Sudden infant death syndrome (SIDS)
  - Acute respiratory infections
  - Ear problems
  - More frequent attacks of asthma in children

- Complications from tobacco use include:
  - Ten fold increase in the risk of dying from Chronic Obstructive Pulmonary Disease (COPD)
  - Cigarette smoking has many adverse reproductive and early childhood effects, including an increased risk for infertility, preterm delivery,
stillbirth, low birth weight, and sudden infant death syndrome (SIDS).
- Postmenopausal women who smoke have lower bone density than women who never smoked. Women who smoke have an increased risk for hip fracture than lifetime non-smokers.

The Healthy People 2010 objective is to reduce the prevalence of cigarette smoking among adults to ≤12%.

Examples of several chronic diseases and associated risk factors are provided in Table 21-1.

Obesity and Physical Inactivity

Definitions:
Overweight and obesity are labels for weight ranges that are greater than what is generally considered healthy for a given height. For adults, overweight and obesity are determined by using weight and height to calculate Body Mass Index (BMI). BMI does not measure body fat directly, but research has shown that BMI correlates to direct measures of body fat, such as underwater weighing.

Physical activity is the measure of how hard your body is working, and is categorized as light, moderate or vigorous, based on the amount of energy or effort a person expends in performing the activity.

Importance:
There has been a dramatic increase in obesity in the United States in the past 20 years. More than one-third of U.S. adults – over 72.5 million people – were obese in 2007-2008. In California, more than half of adults and one-fourth of adolescents are overweight or obese. California ranked 9th out of all states for lowest percentage of obese adults (8 States had lower percentages of obese adults).

People who are obese are at increased risk for heart disease, high blood pressure, type 2 diabetes, arthritis-related disabilities, some cancers, sleep disorders, depression, and other mental health disorders. The estimated total costs of obesity were projected by the CDC to have risen to $92.6 billion in 2002 dollars. A ten percent improvement in the number of people becoming more active and maintaining a healthy weight over a five year period could result in savings of nearly $13 billion.

Regular physical activity can improve health, and reduce the incidence of obesity and risk of premature death from cardiovascular disease, stroke, and heart attacks. Regular physical activity can also lower the risk of developing high blood cholesterol, developing high blood pressure, developing type 2 diabetes, developing colon cancer, and developing feelings of depression and anxiety.

People at risk
BMI can be considered an alternative for direct measures of body fat. Additionally, BMI is an inexpensive and easy-to-perform method of screening for weight categories that may lead to health problems. The formula is as follows:

\[ \text{BMI} = \frac{\text{weight (kg)}}{[\text{height (m)}]^2} \]

For adults 20 years and older, BMI is interpreted using standard weight status categories that are the same for all ages and for both men and women.
For children and teens, on the other hand, the interpretation of BMI is both age- and sex-specific. It is based on how the child/teen’s BMI compares to the 2000 CDC growth chart.

National Objective: The Healthy People national objectives for 2010 (HP 2010) include:

- Increase the proportion of adults who are at a healthy weight to 60%.
- Reduce the proportion of adults who are obese to 15%.
- Reduce the proportion of children and adolescents who are overweight or obese to 5%.

Although Healthy People 2010 does not have specific goals for physical activity, the CDC recommends that adults do one of the following:

- A minimum of 30 minutes of moderate-intensity physical activity per day (such as brisk walking) most days of the week

  or

- A minimum of 20 minutes of vigorous-intensity physical activity (such as jogging or running) 3 days a week.

Key Findings: In 2009, no state met the Healthy People 2010 obesity target of 15%. According to the 2009 California Health Interview Survey (CHIS), an estimated 24.4% of adults in California are classified as obese, while 19.8% of San Luis Obispo County residents are. Another 42.1% of SLO County residents are overweight, while 35% of Californians overall are overweight.
According to the 2009 CHIS, 21.1% of San Luis Obispo County teenagers (age 12-17) were deemed at risk of being overweight compared to 16.7% across the entire State. 12.1% of San Luis Obispo County teens are obese, compared to 12.0% of teens across California. Neither San Luis Obispo County nor California are meeting the HP 2010 objectives. (Note: SLO County teenage data is statistically unstable).

Between 1999 and 2010, the percentage of persons reporting engaging in some form of regular physical exercise at least three days a week increased from 72.8% to 77%. During the same period, the percentage of people taking part in some form of exercise 1-2 days a week also increased from 13.1% to 16.2%. (Data Source: ACTION for Health Communities 2010)

Primary Prevention Activities:

Promoting regular physical activity and healthy eating and creating an environment that supports these behaviors are essential to addressing the problem.
