The analysis presented is based on a hypothetical dam failure using 2D modeling software with a 100' grid. The inundation map meets all applicable state and federal standards and has been prepared in consideration of all potential downstream hazards by a licensed civil engineer.

1. This map was developed for the benefit of local emergency managers and the California Emergency Management Agency. The information shown is approximate and should be used as a guide for emergency response and preparation purposes.

2. The inundation map shows the time to achieve 1 foot of water depth after initiation of the dam break. Stations are in feet (Stationing 12+34 = 1,234').

3. The approximate time to 1 foot depth is in minutes.

4. Cross Section Values continued:
   - Time Above 1 Foot
   - Peak Water Elevation
   - Peak Discharge
   - Peak Inundation Depth

5. Cross Section 10

7. Structures are shown in the aerial photo on the maps but may not clearly display all possible structures potentially within the inundation limits.

8. Without prior notification to the Federal Dam Owner, do not distribute this map or the associated model information.
