2016-2020

County of San Luis Obispo, Department of Public Works

County Government Center, Room 206

San Luis Obispo, CA 93408

SYSTEM INFORMATION

SWRCB-DDW System No.: 4010022

System Name: Lopez Project

Survey Period: January 1, 2016 through December 31, 2020

PREPARER INFORMATION

Name of Agency and Address: County of San Luis Obispo, County Government Center,
Room 206, San Luis Obispo, CA 93408

Contact Person, Position/Title, Positions/Titles, and Telephone Numbers:

3/17/2021

Danielle Ruedas, Water Systems Chemist, (805) 781-5109

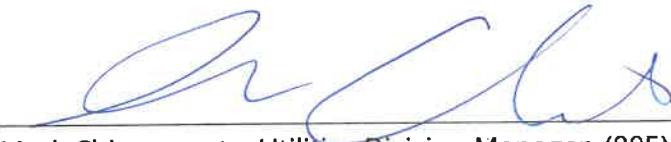

3/17/2021

Faith Zenker, Water Quality Manager, (805) 781-1576

3/18/2021

David Spiegel, P.E. Water Operations Engineer, (805) 788-2111

3/22/2021

Mark Chiaramonte, Utilities Division Manager, (805) 781-1186

SWQCB-DDW Approval, Signature, and Date:

SURVEY DESCRIPTION

Name of Watershed: Lopez Lake and Lopez Terminal Reservoir

Total Watershed Size in acres: Lopez Lake - 43,000 acres

Lopez Terminal Reservoir - 424 acres

Location (list counties in which watershed is located or attach map): San Luis Obispo

Name(s) of water treatment plant using the watershed as a source: Lopez Water Treatment Plant

B. Difficulty meeting drinking water standards		X	

EXECUTIVE SUMMARY AND BACKGROUND

A watershed sanitary survey is required by the State Water Resources Control Board – Division of Drinking Water for all surface water influenced water supplies. The survey must be updated every five years, identifying existing or potential hazards to the water supply source. The original survey of the Lopez Lake and Terminal Reservoir watersheds was completed in December 1995. Updates were completed in March 2001, January 2006, March 2010, March 2015. This watershed sanitary survey update includes all sampling and field observations from 2016 through 2020. A significant upgrade to the Lopez Water Treatment Plant was completed in 2007, but no significant changes to the watershed were noted since the last survey.

The sanitary survey's objectives are as follows:

- Identify existing sources of water contamination.
- Identify potential future sources of water contamination.
- Provide a baseline of water quality and watershed condition for identification of trends in future survey updates.
- Recommend watershed management practices that will protect raw water quality of this valuable local water source and minimize the need to import water.

The Lopez Project encompasses Lopez Lake, the raw water piping from the Lopez Lake intakes to the Terminal Reservoir, the Terminal Reservoir, the Lopez Water Treatment Plant (LWTP), and the treated water distribution system. The Lopez Project is owned by the County of San Luis Obispo Flood Control and Water Conservation District – Zone 3 (District) and provides water to the City of Arroyo Grande, Grover Beach, Oceano Community Services District, Pismo Beach, County Service Area 12, and Avila Beach Community Services District.

The Lopez Lake and Terminal Reservoir watersheds continue to be sparsely populated. There are no existing or abandoned mines, no significant concentrated animal populations, and no major transportation corridors traversing the watershed.

Full body contact recreation activities at Lopez Lake have the potential to affect water quality, but no adverse effects have been noted. Lopez Lake is well patrolled daily by County staff. The Lopez Lake Recreation Area is serviced by an extended aeration sewage treatment plant which is maintained by the County General Services Department. All sludge is transported out of the watershed for final disposal. A raw sewage force main is suspended over Wittenberg Creek Arm and a treated wastewater force main delivers effluent to a land disposal area.

The Terminal Reservoir acts as a raw water impoundment providing 30 to 45 days detention time for Lopez Lake water prior to being treated at the LWTP. Runoff from a half mile

segment of Orcutt Road drains into the Terminal Reservoir, but a diversion channel encircles the remainder of the Terminal Reservoir and prevents runoff from entering the reservoir.

Security was increased at the LWTP in 2006. A “passcode” operated gate now controls access to the Terminal Reservoir and the LWTP 24 hours per day. Unrestricted public access is not allowed and all visitors are required to register at the facility office. Most of the access around the LWTP and Terminal Reservoir are enclosed with a chain-linked or barbed wire fencing. No trespassing signs are posted around the Terminal Reservoir. Similarly, the Lopez Lake Recreation Area is fenced and posted. Public access to Lopez Lake is fee based and controlled by County of San Luis Obispo Parks staff.

In May 2007, the Lopez WTP was upgraded from a conventional coagulation, sedimentation, filtration plant to a dissolved air flotation/low pressure membrane microfiltration plant. The use of chlorine dioxide, chlorine, and chloramines for disinfection was not changed.

July of 2017, a pH suppresser was added to the initial treatment of the raw water coming into the plant. As the raw water exits the terminal and enters the influent pipeline it may be treated with a mineral acid (Hydrochloric acid) to reduce the pH of the incoming water. The mineral acid will help to reduce or eliminate the amount of scaling that occurs within the plant when pH levels in the terminal reach 8.2 or higher and temperature reaches 18.0° C or higher (2019 Lopez Water Treatment Plant Operations Plan).

Wastewater collection and disposal, recreational activities, landslides, earthquakes, and fire continue to represent the most significant potential sources of contamination to the Lopez Lake watershed. Runoff from, or accidents on, Orcutt Road remains the most significant potential source of contamination to Lopez Terminal Reservoir.

WATERSHED AND WATER SUPPLY DELIVERY

The “Lopez Project” is a water delivery system consisting of Lopez Lake and Lopez Terminal Reservoir, each with an outlet structure. They are interconnected by a 3-mile-long gravity line. The Terminal Reservoir supplies raw water to the Lopez Treatment Plant which delivers potable water to a 2.25-million-gallon clear water reservoir and 25 miles of distribution line. This sanitary survey update examines both the Lopez Lake watershed and the smaller Terminal Reservoir watershed.

Lopez Lake Description

The Lopez Lake watershed is comprised of 43,000 acres of land, which lies predominantly in the Los Padres National Forest. The remainder of the property which makes up the watershed is owned by the County of San Luis Obispo Flood Control and Water Conservation District – Zone 3, private campgrounds, and private landowners. All property immediately adjacent to Lopez Lake is owned by the District. The soils range from a silty clay loam on

alluvial plains to well-drained soils on hills and mountains. As shown in Appendix A1, Vasquez Creek, Lopez Creek, Wittenberg Creek Arm, Arroyo Grande Creek, and Clapboard Canyon Creek Arm feed Lopez Lake. Lopez Lake has a maximum surface area of approximately 974 acres and a storage capacity of 49,200 acre-feet. No population centers are located within the watershed. Scattered residential dwellings, horse ranches, croplands, and cattle grazing areas, are located within the watershed. Wildlife in the area consists of deer, resident and migratory birds, and various small mammals. Wild animal populations are considered to be moderate to light. No mining or logging activities are known to occur within the Lopez Lake watershed.

Watershed: Lopez Lake
Acres: 43,000
Lake Surface Area: 974
Lake Storage Capacity: 49,200 acre-feet
Weir Crest: 522.6'
Infrastructure: Screened multi-port intake structure (seven intakes spaced 15 feet apart; Intake and outlet building; manual butterfly valves
Pipeline: 3 miles gravity fed to Lopez Terminal reservoir
Intake Elevations:

Level Description	Elevation, feet
Intake 1	507.6'
Intake 2	492.6'
Intake 3	477.6'
Intake 4	462.6
Intake 5	447.6
Intake 6	432.6
Intake 7	417.6
36" butterfly valve	403.6'

Turnouts

- Lopez Terminal Reservoir
- Lopez Distribution (emergency use only)

Pump Stations - None

Storage Tanks - None

Chemical Treatment - No chemical treatment is provided at any point along the transmission main.

Lopez Lake Watershed Security

Intake protection is provided by a log boom on the lake and fencing along the shore. It is located approximately 50' away from the intake pipe at all points. Fencing is installed along the lake shore adjacent to the intake, and all around the intake building. No trespassing signs are posted at frequent intervals along the fence to prohibit public access to the lake near the intake and dam.

The lake is patrolled morning and evening by County Park rangers. Potential contaminants to the reservoir include:

- Wastewater collection system
- Septic systems
- Industrial runoff
- Agriculture/cropland
- Herbicides/Pesticides
- Grazing animals
- Wild animals
- Hazardous material storage (petroleum products, wine production, water treatment, fueling stations)
- Recreational use (boating, body contact, fishing)
- Cultivation of marijuana

Lopez Terminal Reservoir

The Terminal Reservoir watershed is comprised of 424 acres immediately adjacent to Lopez Lake Water Treatment Plant which is located approximately 12 miles northeast of the City of Arroyo Grande. The topography is similar to the Lopez Lake watershed. The property which makes up the watershed is owned by the County of San Luis Obispo Flood Control and Water Conservation District and private parties. All property immediately adjacent to the Terminal Reservoir is owned by the district. There are two residences located within the Terminal Reservoir watershed, occupied by county staff and their families. There are no defined waterways within the watershed which are tributary to the Terminal Reservoir. Runoff from much of the area is diverted away from the reservoir by means of an 8 to 10-foot-wide diversion channel. The only significant inflow to Terminal Reservoir is the influent line from Lopez Lake. Orcutt Road traverses the Terminal Reservoir, essentially dividing the reservoir into two sections. Surface runoff from the watershed to the Terminal Reservoir is minimal and occurs from precipitation and minor runoff from within the non-diverted portion of approximately 23.8 acres. If not captured and removed, any spills that occur along the half-mile section of Orcutt Road have the potential to drain into Terminal Reservoir. The Reservoir has a maximum capacity of 844 acre-feet of water. Aerial photos of both watersheds are attached in Appendix A1, A2 and Figure 1.

Watershed:	Lopez Terminal Reservoir										
Acres:	424										
Reservoir Surface Area:	37										
Reservoir Storage Capacity:	844 acre-feet										
Weir Crest:	328'										
Infrastructure:	Intake building at far end of terminal reservoir; Screened multi-port outlet structure (four intakes spaced 6 feet apart; Outlet										
Pipeline:	Gravity fed 36" outlet line to Lopez WTP

Intake 4	305'										

Turnouts

- Lopez Water Treatment Plant
- Lopez Release to Creek

Pump Stations - None

Storage Tanks - None

Chemical Treatment – Algaecides within terminal reservoir to aid in treatment of the facility.

County of San Luis Obispo
Lopez Lake and Terminal Reservoir
2016-2020 Watershed Sanitary Survey

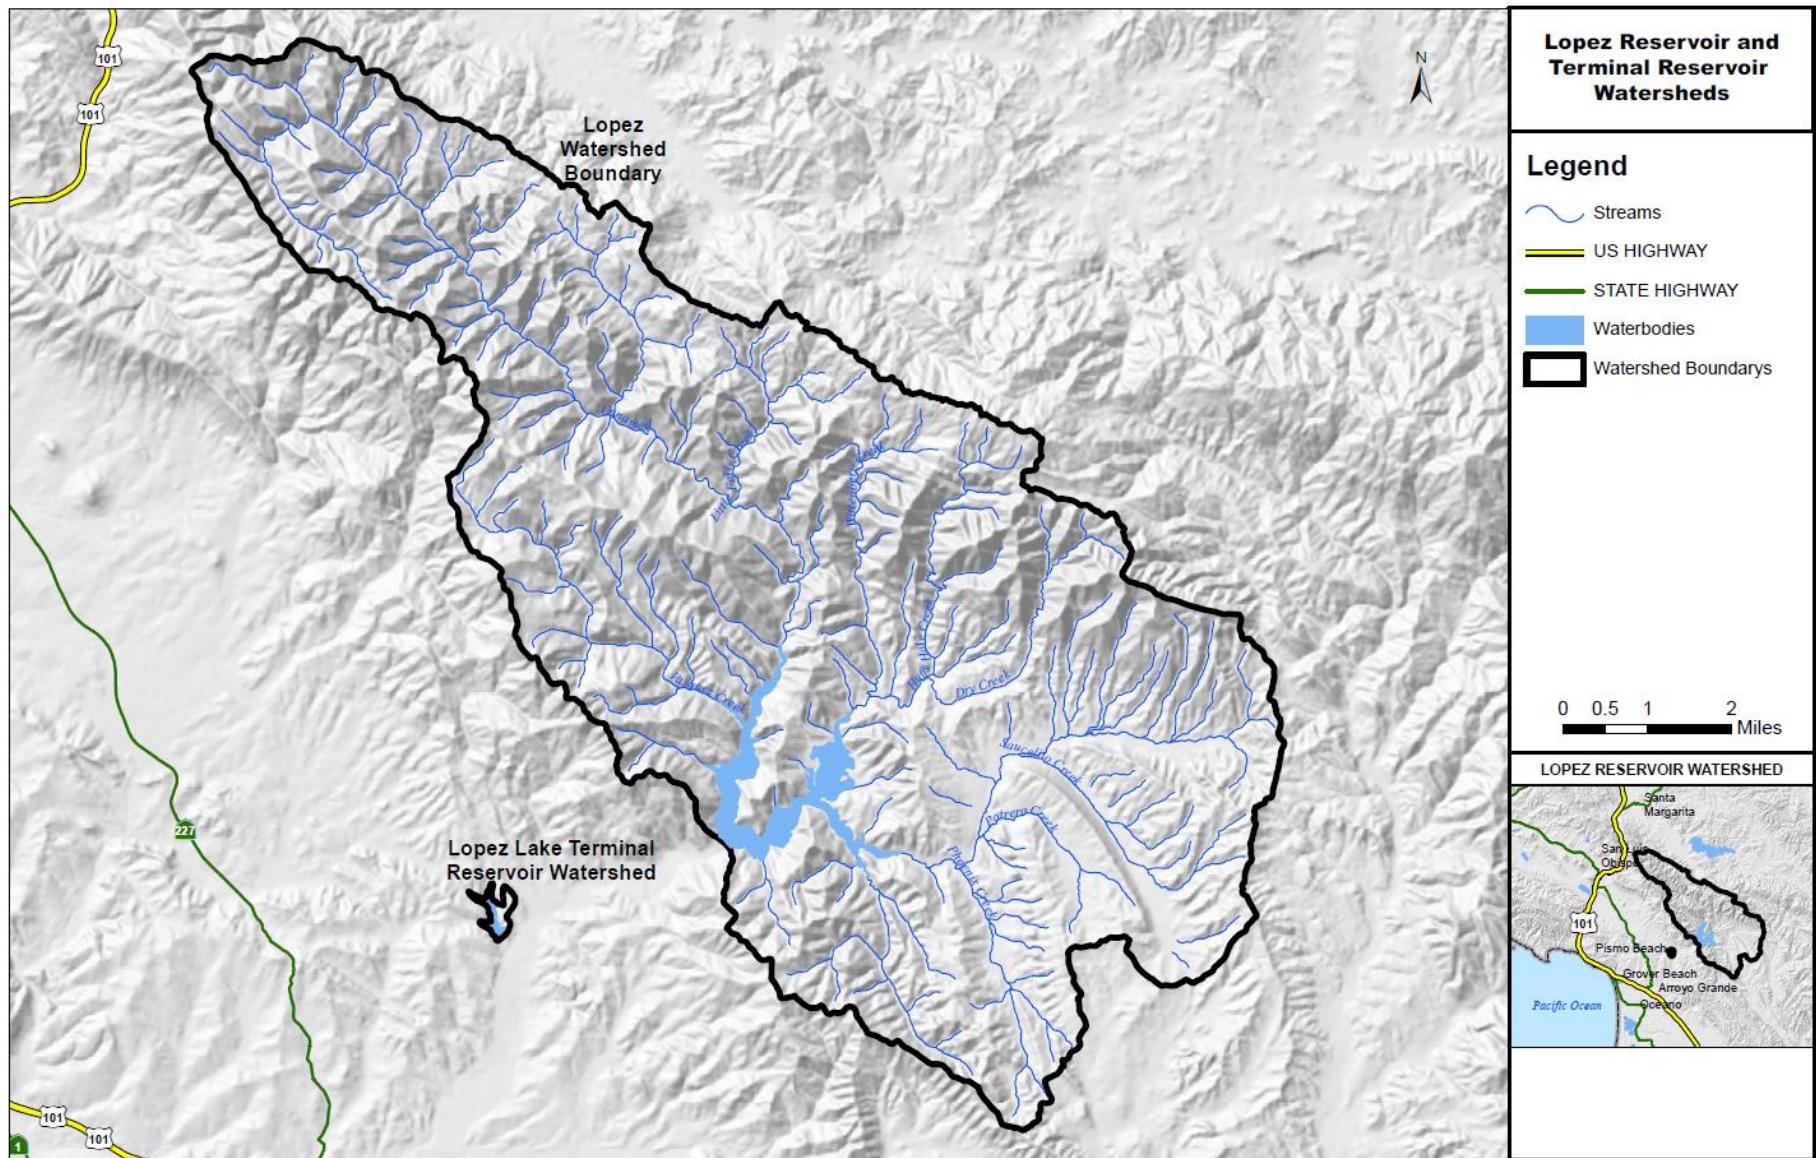

Figure 1: Lopez Lake and Terminal Watershed

Lopez Terminal Watershed Security

Access to the Terminal Reservoir and the Lopez Lake Water Treatment Plant is now controlled 24 hours per day. Entry is limited to personnel and visitors authorized by the County of San Luis Obispo. All visitors must enter through a locked, passcode controlled, security gate and sign in at the facility. The gate includes video surveillance. Additionally, the County maintains two residences on site for operations staff that provides after-hours surveillance and deters trespassing. The lake is patrolled morning and evening by County Park rangers. Potential contaminants to the reservoir include:

- Orcutt Road spill
- Wild animals

Lopez Water Treatment Plant:

Type of Source:	One Surface Water Treatment Plant. No ground water wells.
Type of Treatment Provided:	Conventional treatment utilizing pre-disinfection with chlorine dioxide, dual-media filtration, post-disinfection with chlorine, ammonia injection process for finished water chloramines.
Average Water Demand:	4.5 MGD

Maximum and Peak Water Demand:

- 4.25 MGD (Max)
- 6.0 MGD (peak)

Distribution Line:

Number of service Connections: 33 Service Connections

Population: 50,000

Interconnections:

- State Water: Lopez Turn-out
- Arroyo Grande Turn-out
- Pismo Beach Turn-out
- Grover Beach Turn-out
- CSA-12 Master Meter
- Avila Beach CSD
- Flexible usage of monthly entitlements
- Emergency water supply for CSA-12

PREVIOUS SANITARY SURVEY SUMMARIES AND PENDING RECOMMENDATIONS

Summary of Past Sanitary Surveys

The original watershed survey was conducted by Boyle Engineering in 1995. Boyle Engineering concluded that the location of the reservoirs helped preserve watershed water quality. The Lopez Lake watershed was considered sparsely populated. There were no records of existing or abandoned mines, no concentrated animal populations, and no major transportation corridors traversing the watershed. However, both reservoirs are susceptible to the following sources of contamination: wastewater, animal grazing, fuel storage, recreational activities, unauthorized activities, use of pesticides and herbicides, geologic formations, and hazardous materials spills.

A ramp crossing on Wittenberg Creek Arm had partially collapsed and threatened to expose and damage the sewer and water laterals located beneath the ramp. Repair was recommended and a new bridge was built in its place.

The 2006 survey reported some increase in agricultural activity in the Arroyo Grande arm of the Lopez Lake with some vineyards in this section of the reservoir.

The 2006 survey reported that the log boom around the Lopez Lake intake structure had been extended and improved to provide a buffer zone from recreational body contact. Although the distance separating the log boom from the intake structure was less than the optimal 500 feet, the buffer zone was deemed sufficient, given the Terminal Reservoir provided an additional 30-to-45-day detention time of the water without body contact.

The heavy recreation activities at the lake, and the domestic wastewater generation are still considered unfavorable and potential sources for contamination at Lopez Lake. However, the main recreation area continues to be well patrolled and is fully sewered with an extended aeration treatment plant.

The Terminal Reservoir watershed was viewed as susceptible to runoff and accident spills along the section of Orcutt Road which drains directly into the reservoir. The District found it cost prohibitive to address this issue based on the level of threat to the reservoir and this is still unresolved.

Additional growth and development next to the Terminal Reservoir raised some concern about unauthorized public access to the Terminal Reservoir and the Lopez Water Treatment Plant. Fencing was noted as being good at the most visible locations, but minimal around

some less accessible sections of the reservoir. The less accessible sections had barbed-wire fencing and were posted.

Pending Recommendations:

1. Hazardous materials spills and animal grazing may drain into Lopez Terminal Reservoir. Construct a piping system whereby the drainage off Orcutt Road is collected and conveyed away from the Terminal Reservoir by installing a piping system or route runoff to an unlined pond (5,000-10,000 gallons) where it can be collected and conveyed away from the Terminal Reservoir.

Status: Options for re-routing Orcutt Road drainage were evaluated and deemed cost prohibitive. Due to the lack of funds and an unfavorable cost versus benefit ratio, implementation of this recommendation remains a low priority. If a spill were to occur on the vulnerable section of Orcutt Road, attempts would be made to capture and reclaim the spill.

2. The District should continue to make efforts to limit the amount of grazing in and around the watershed areas, including Lopez Terminal Reservoir and WTP. The diversion channel should be extended along Orcutt Road to encompass privately held grazing land that drains onto the road and into the reservoir.

Status: Significantly implemented. Cattle grazing is not permitted anywhere within the District owned property adjacent to the Terminal Reservoir or in the watershed areas. This includes all property directly bordering Lopez Lake and the Terminal Reservoir. When stray cattle are observed on District property, the owner is notified, and the cattle are removed. Minor cattle grazing may occur on a very small section of privately owned land within the watershed that has the potential for drainage onto Orcutt Road and into the farthest reach of the Terminal Reservoir. Coliform, Giardia, and Cryptosporidium monitoring to date has not found this to be a problem.

3. Fencing of the Terminal Reservoir watershed should be completed, especially in areas not visible from the treatment plant site.

Status: Significantly Implemented. Access to the Terminal Reservoir and the Lopez Lake Water Treatment Plant is now controlled 24 hours per day. Entry is limited to personnel and visitors authorized by the County of San Luis Obispo. All visitors must enter through a locked, passcode controlled, security gate and sign in at the facility. The gate includes video surveillance. Additionally, the County maintains two residences on site for operations staff that provides after-hours surveillance and deters trespassing. Fencing

is still needed in the West portion of the terminal. Due to the steepness of the terrain and vegetation it makes it mostly impassable, therefore it is low priority. Once funding becomes available this area will be re-evaluated.

4. Monthly samples should continue to be tested at all organized swimming beaches in the Lopez Lake Recreation Area.

Status: Not implemented as recommended based on water quality data review. Monthly sampling for total coliform and *E.coli* at the designated swim areas was discontinued as the analysis data indicated the swim areas were not having an adverse impact on the quality of the water exiting Lopez Lake. Weekly coliform testing is performed on the water exiting Lopez Lake and on the raw Lopez Terminal water entering the Treatment Plant. The addition of area C and D bacteriological sampling contributes and helps document the background lake TC/EC levels in the swim area.

5. Monthly samples should be collected from the Terminal Reservoir outlet towers and the plant effluent to be analyzed for phosphate.

Status: Implemented. The Terminal Reservoir is tested for phosphates and nutrients monthly.

6. The scope of the inflow creek sampling program should be maintained and/or expanded in terms of scope and frequency.

Status: Implemented. General mineral analyses are performed quarterly, the recommended frequency. Inorganics are analyzed annually rather than quarterly. Nitrates and nitrites are analyzed monthly rather than quarterly. Pesticides and herbicides are analyzed every nine years rather than annually. There was no recommendation for VOCs analysis, but they are analyzed every three years.

7. Water Quality and Hazard concerns for Harmful Algae Blooms (HABs)

Status: Implemented. Continue to screen for algal toxins when blooms are detected. Sampling and testing should occur at any Lake or Terminal site experiencing a significant blue-green bloom (blue-greens greater than 2000 cells/mL), at the Terminal before and one week after treatment for blue-green algae (in order to assess the possible release of toxins from dead or dying algae), and at the "Treatment Plant – Raw" and "Treatment Plant – Treated" sites after any detection of algal toxins in the Terminal. HAB results are voluntarily reported to the California State Water Resources Control Board's data system on the CA HABs Portal.

CURRENT WATERSHED DATA EVALUATION AND SUMMARY

This section will summarize water quality issues in the watershed based on data collected from analysis and field inspections over the past five years. However, the most significant impact to the watershed area over the past couple of years would be the decrease in the amount of rainfall in our watershed as well as throughout the state of California. Vegetation in the watershed has been visibly dry, and water levels in Lopez Lake, watershed, and surrounding groundwater aquifers are lower. As the drought continues, longer term impacts can emerge and could possibly alter or damage native ecosystems for both aquatic and riparian species.

Data availability has decreased from the previous watershed survey due to budget restrictions placed upon sampling and analysis of the watershed area as well as the decrease in water levels. All data is available for review in the following document as well as historical precipitation levels.

Microbiological Summary

Total coliform, *E. coli*, *Giardia* and *Cryptosporidium* levels in the watershed creeks are monitored routinely as a potential indicator of pathogens in the watershed. Less data is available from Wittenberg, and Vasquez Creeks due to a severe drought in 2016.

As shown in Table 1, Clapboard Canyon Creek Arm and Vasquez Creek had the highest total coliform levels on average over the past five years (both creeks had low flow from 2016-2020). Vasquez Creek and Arroyo Grande Creeks had the highest *E. coli* levels on average over the last five years (Figure 2 and 3). Cryptosporidium oocysts and Giardia cysts were found in Arroyo Grande Creek. As stated, prior, drought conditions could be causing significant impacts in all the creeks data. Arroyo Grande Creek and Lopez Creek have been the only creeks consistently flowing throughout the last five years, whereas the other creeks have become dry. When comparing this survey with the previous survey (2011-2015) both *E.coli* and total coliform have decreased in Arroyo Grande and Lopez creeks and have increased in both Clapboard Canyon Creek Arm and Vasquez Creek. Wading birds, waterfowl, and wildlife inhabit the Lopez watershed area. It is possible that because of drought conditions, they may be concentrating or relocating to these areas causing an increase in populations in those areas and in turn increasing nutrient levels in both creeks (Raw data can be found in Appendix B1).

While wildlife, grazing animals, and agricultural activity have been observed upstream of the sampling locations in all the monitored creeks, Arroyo Grande Creek is believed to have the greatest number of grazing animals and the most agricultural activity.

During the period covered by this survey update, coliform and *E. coli* levels seem to vary with the time of year. However, Arroyo Grande Creek seems to be holding steady from one year

to the next which may have to do with drought conditions. Monitoring of the creeks for pathogens or pathogen indicator species should continue as wild and domestic animals can be significant sources of microbial pathogens like *Giardia* and *Cryptosporidium*.

Under the California Health and Safety Code Department's draft "Guidance for Freshwater Recreational Areas," body-contact reservoirs must monitor for microbial quality. This monitoring should consist of sampling for total and fecal coliform bacteria. Samples for *E. coli* and enterococcus bacteria are also recommended. Going forward Lopez Lake and Influent to Terminal sampling will include enterococcus monitoring. The recreation area should post appropriate signage if levels ever exceed the values in Table 2.

Table 2: Bacteria Exceedance Levels

Parameter	Single Sample (MPN/100 mL)	30-day Average (MPN/100 mL)
Total coliform	10,000	1,000
Fecal coliform	400	200
<i>E. coli</i>	235	126
Enterococcus	61	33

Field Inspection Summary of Sections

Lopez Lake (Figure 4) is known for its great fishing and recreation. It is also a main water source for South San Luis Obispo County. Weekly/monthly personnel sample the water quality to ensure the best delivered water.

Figure 4: Lopez Lake Marina and Launch Ramp

The lake has been divided into sections A-K to better understand and identify the sampling and monitoring areas of the lake. Map scaling is approximate (Figure 5).

County of San Luis Obispo
Lopez Lake and Terminal Reservoir
2016-2020 Watershed Sanitary Survey

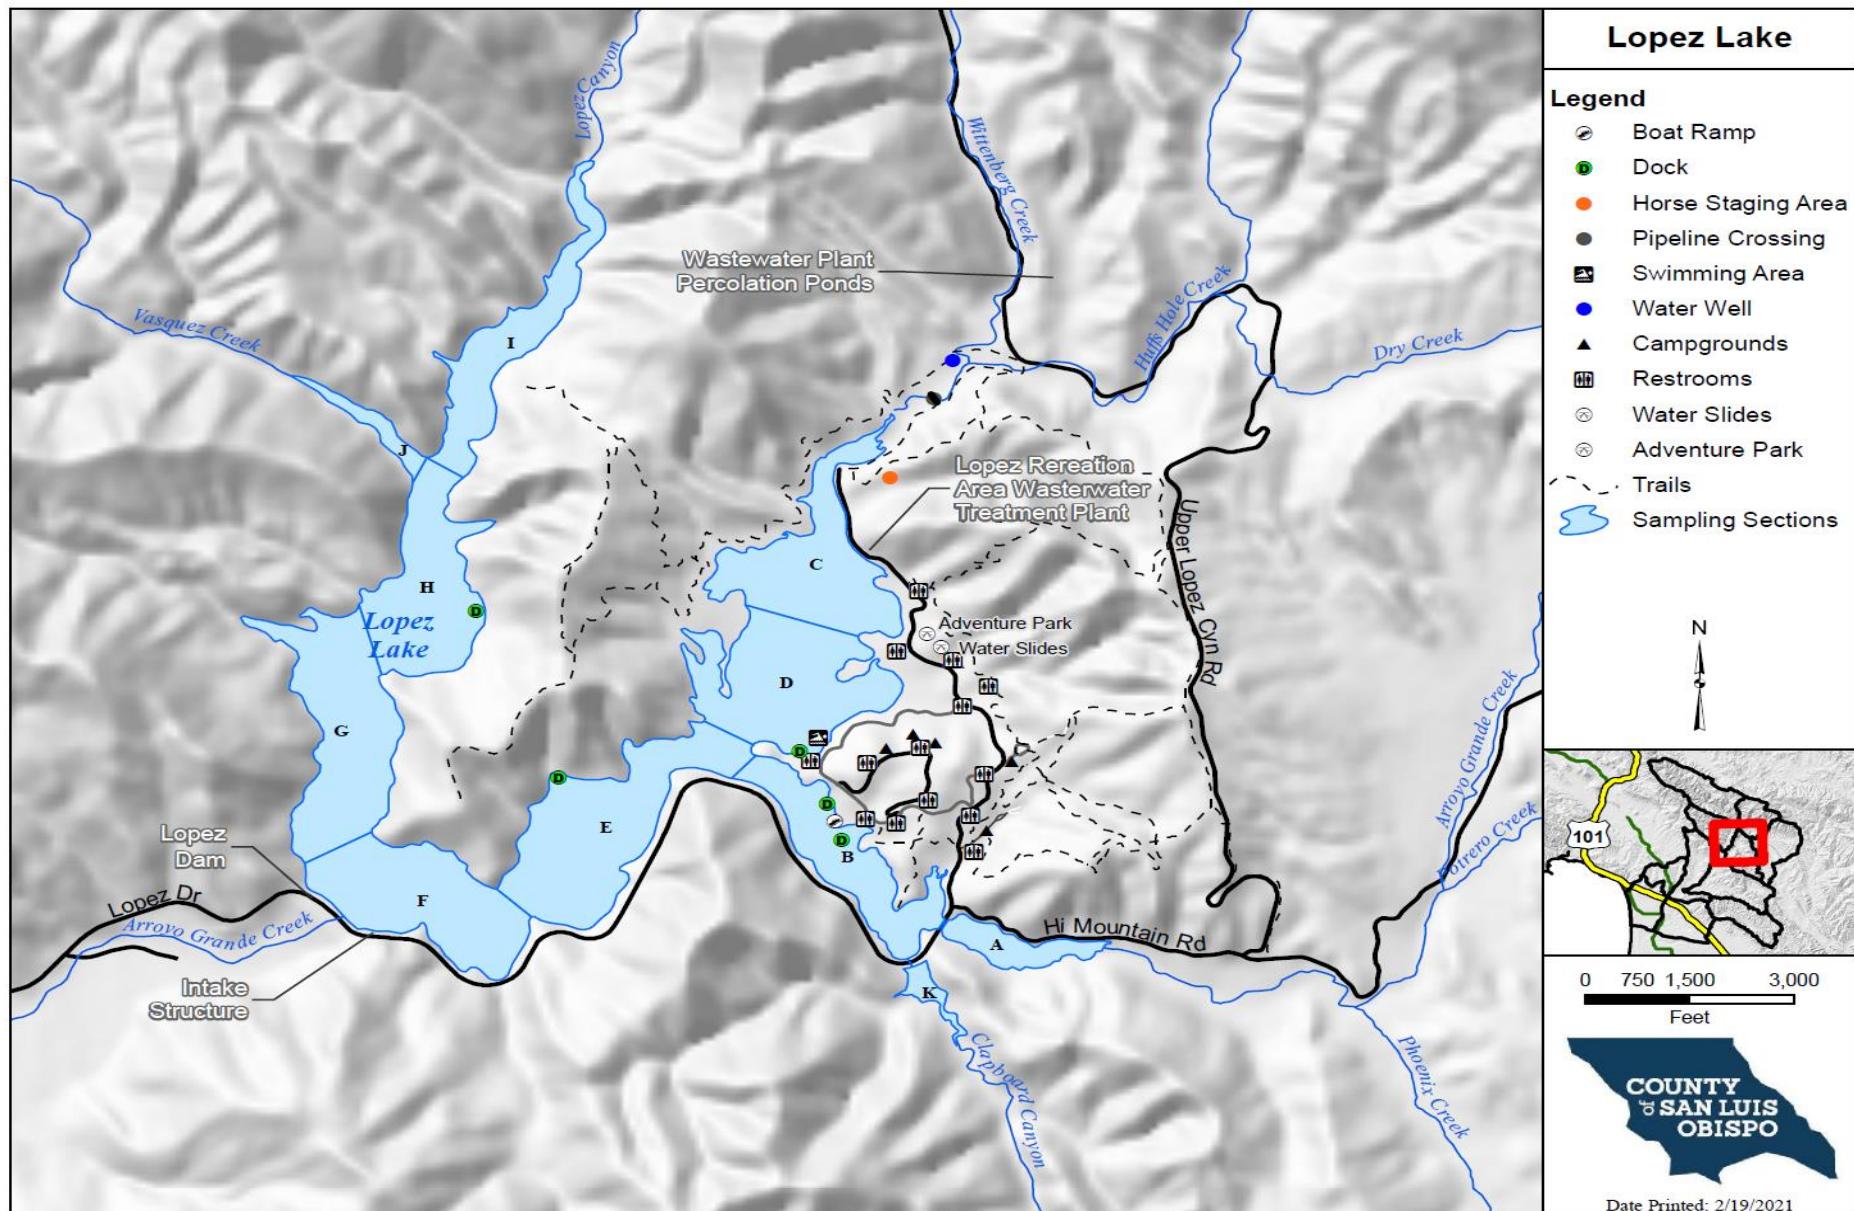

Figure 5: Lopez Reservoir and Creeks in Lopez Watershed

Lopez Lake: Field Inspection Summary of Sections A, B, and K

Lopez Lake Section A, B, and K, are fed by Clapboard Canyon Creek Arm. When there is adequate water levels, wading birds preferred Section A, and occasionally Section B. Deer are often found along the water edge of Section B.

Lopez Lake: Field Inspection Summary of Sections C and D

Lopez Lake Section C is fed by Wittenberg Creek Arm. Vista Lago, a designated swim area, is located along the shore of Section C and Section D. This section of the lake is popular for windsurfers and swimmers. The wastewater treatment plant for the Lopez Recreation Area is also located adjacent to Section C. Wittenberg Creek Arm does not flow year-round; therefore, Section C water can become stagnant. The increased water temperature, low circulation, and prevailing wind patterns can promote algae and weed growth. Wittenberg Creek Arm is tested quarterly for coliform bacteria when flowing. Bacteriological monitoring of Section C is scheduled monthly (Table 3). However, Section C of Lopez Lake was dry for several months during the 2015-2016 calendar year. During this time, a bacteriological sample was taken from Section D to ensure recreation was safe for body contact sports. Winter of 2016 was a heavy rainy season and Wittenberg Creek Arm was flowing for the first time in many years. Some water quality data was higher than normal; this was expected.

The lake's camping area is within the Wittenberg Creek Arm and Arroyo Grande Arm shown in Figure 5. In 2019, there was a small fire in the Northern part of Wittenberg Creek Arm arm due to a campfire. The fire was quickly controlled and did not spread to the lake or harm the watershed. Lopez Lake has a high fire watch during the dry, windy warm months.

Table 3: Summary of Section C Bacteriological Data

Section C Bacteriological Data		
Date	Total Coliforms (MPN/100 mL)	<i>E. coli</i> (MPN/100 mL)
Minimum	2100	<1
Maximum	24000	11
Average	2902	4
Median	1500	2.5
n	34	34

Lopez Lake: Field Inspection Summary of Sections E, F, and G

Several deer and bear can be found along the edge of the lake throughout the year in these sections. Sections E, F, and G, are the most popular for recreational vessels and water skiers. Occasionally cattle from a nearby ranch are found near the water's edge in section F (Figure 6). These areas tend to be very windy in the afternoon.

Section F is where you will find the Lopez Lake's intake structure. A monthly/weekly limnology profile is taken by lab staff to determine the best water quality to deliver to Lopez Terminal. Lopez dam and spillway are also located near section F.

Figure 6: Cattle on hillside near Sections F and G

Lopez Lake: Field Inspection Summary of Sections H, I, and J

Section H is popular for windsurfers and water skiers. This section can become busy during the summer season. Section J is fed by Vasquez Creek and section I is fed by Lopez Creek. This area is most popular for fishing boats. Many types of waterfowl and deer are found in section I along the water edge and in the water. Deer and bear have been spotted in section J near the Vasquez Creek area.

Influent to Terminal:

The “Influent to Terminal” sample location is used to determine the water quality entering the Terminal Reservoir from Lopez Lake. The “Plant Influent” sample is used to determine the water quality after the 30-to-45-day detention time in the Terminal Reservoir and prior to treatment at the Lopez Water Treatment Plant. Bacteriological water quality is similar at these two locations except the Plant Influent tends to have both higher *E. coli* and *total coliform* levels. This may be attributed to waterfowl activity and the nesting swallow population located near the intake structure to the plant influent. Total coliform and *E. coli* levels tend to increase during the spring and taper off during the fall season when water temperatures increase and nesting ceases (Figures 7 and 8).

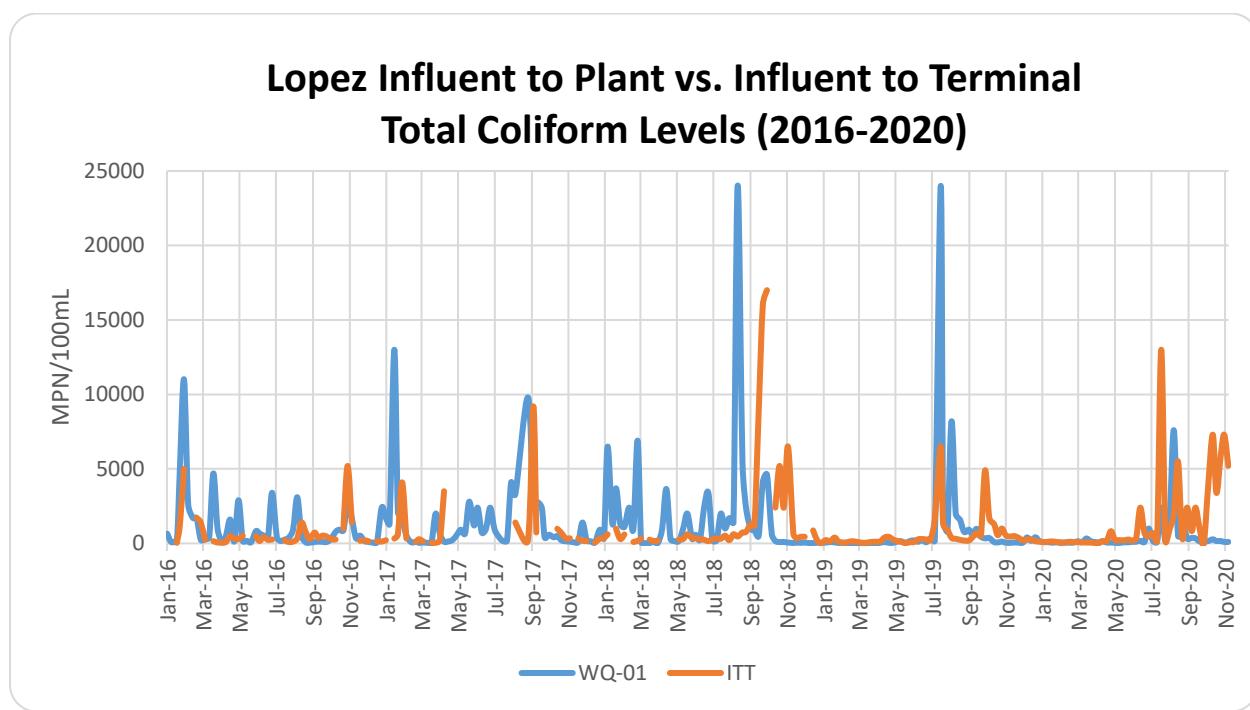

Figure 7: Influent to Plant vs. Influent to Terminal Total Coliform levels

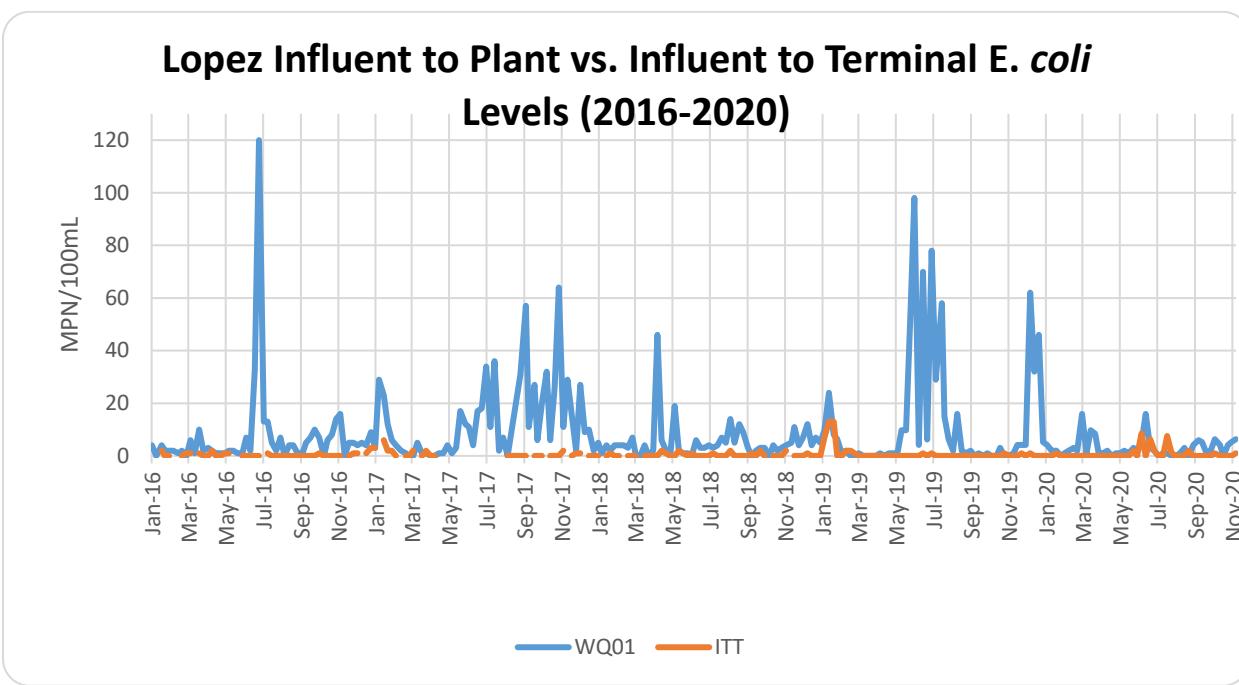

Figure 8: Plant Influent vs. Influent to Terminal *E. Coli* levels

General Mineral and Inorganic Chemical Summary

General mineral and inorganic chemicals are common water quality indicators. Although these chemicals occur naturally in the environment, an increase in concentration may be an indicator of industrial or agricultural contamination in the watershed. Creek and Terminal Reservoir aluminum, arsenic, iron, and manganese levels are summarized in Table 4 (Raw data can be found in Appendix B2 and B3).

Table 4: General Mineral/Inorganic Chemicals Summary, 2016 through 2020

Sample Site		Aluminum (µg/L)	Arsenic (µg/L)	Iron (µg/L)	Manganese (µg/L)

	Median	22	5.3	7.8	14
	Number of Samples	10	29	109	109

Aluminum is a secondary standard with a MCL of 200 ug/L. Aluminum levels in the creeks are typically below the secondary MCL level. There was a slight spike in Arroyo Grande Creek just as it was going dry early 2020 (Figure 9). We also found that, although nowhere near the MCL level, the average aluminum concentration in many of the watershed creeks have increased compared to the numbers from the previous five-year survey. The Lopez Water Treatment Plant Treated water aluminum concentration has consistently met all MCL requirements and remained relatively constant. Aluminum concentration does not appear to be a problem in the watershed at this time.

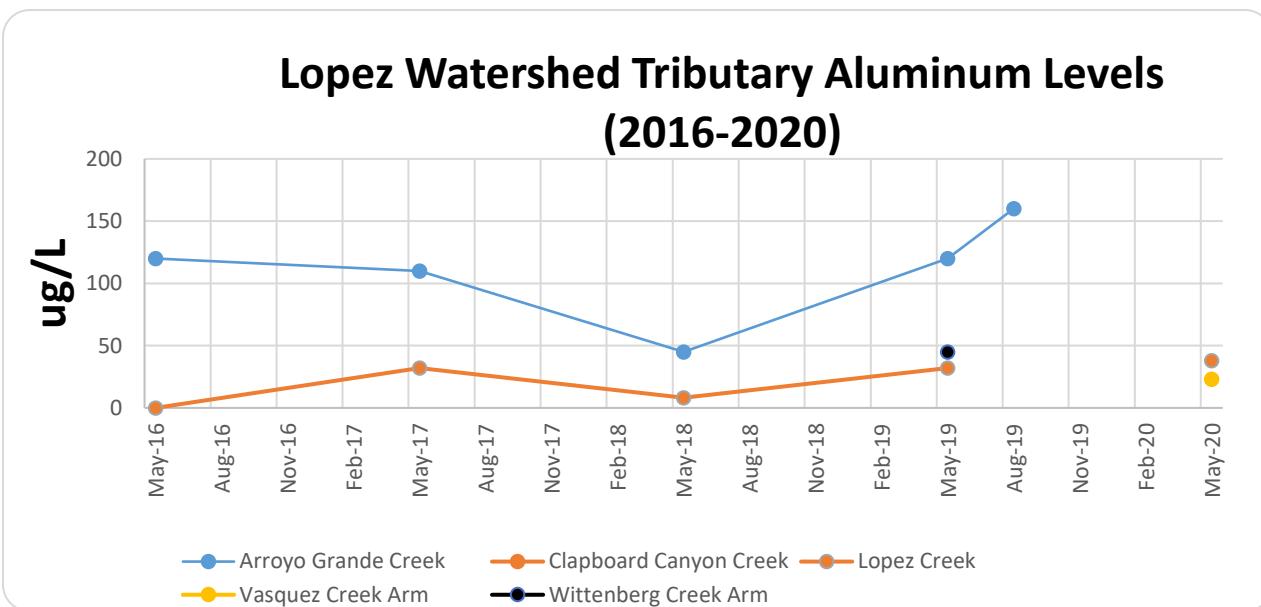

Figure 9: Aluminum Levels in Creeks in the Lopez Watershed

Arsenic has a primary MCL of 10 ug/L in drinking water and can come from natural (erosion of natural deposits; runoff from orchards), or from man-made sources. Arsenic levels in Arroyo Grande creek appear to be slightly increasing. The 10 ug/L arsenic MCL was exceeded in Clapboard Canyon Creek Arm in August of 2017, due to it being the first sample collected in two years (water was noted to be pooling). During this time both the treatment plant raw water and the treatment plant treated water did not exceed the MCL. However, levels increased to over half of the MCL level in Influent to Terminal, Influent to Plant, and Treatment Plant Treated water multiple months in the past five years (Figure 10). Sampling at the water treatment plant increased from quarterly to monthly to keep a close watch on arsenic levels at the plant.

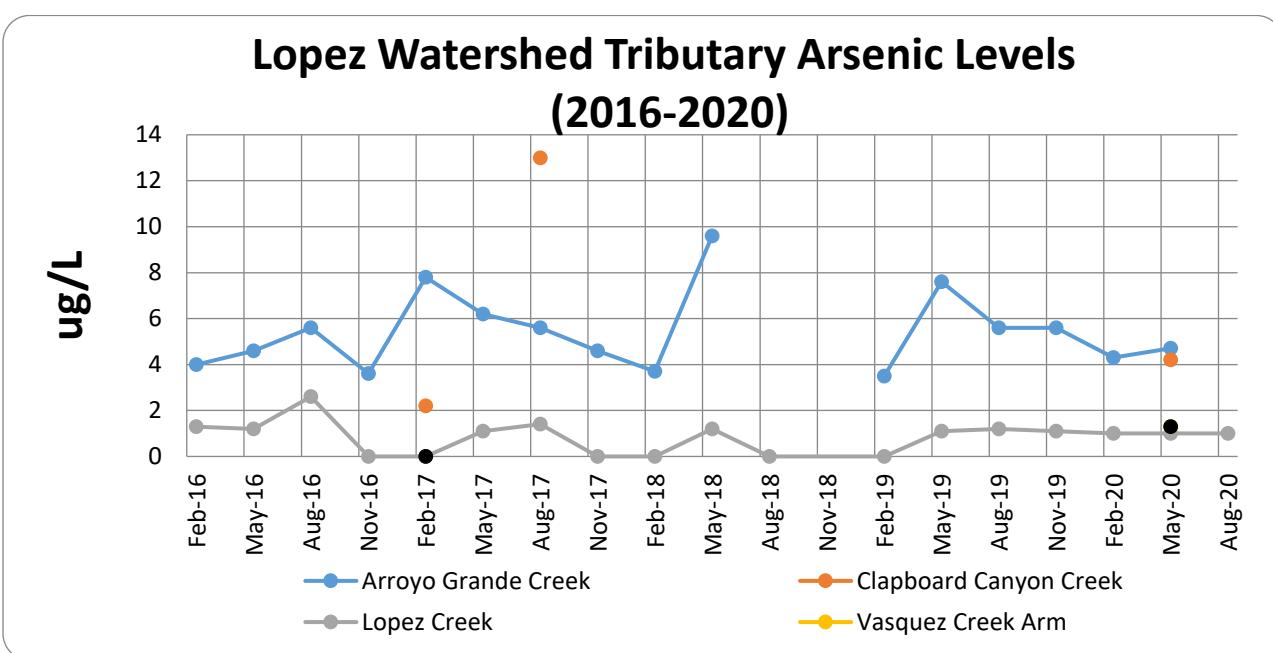

Figure 10: Arsenic Levels in Creeks in the Lopez Watershed

Nutrient Summary

Contributions of nutrients in watersheds can be caused from a variety of sources and environmental circumstances. Several different contributors and circumstances may increase the nutrient levels in the Lopez watershed (animal agriculture, agricultural fertilizer, temperature, runoff of nutrient rich soil, and drought conditions). The appearance of blue green algal blooms is a good indication that the nutrient levels in the watershed has increased.

The growth of macrophytes (aquatic plants) and phytoplankton (algae) can be stimulated by nutrients like phosphorus and nitrogen. "Nutrient-stimulated primary production is more often seen in lakes and estuaries as primary production in flowing water is thought to be controlled by physical factors, such as light penetration, timing of flow, and the type of substrate available, rather than by nutrients."¹ However, phosphorus and nitrogen are important plant nutrients and, when in abundance, can lead to over fertilization of a lake.

¹ www.water.ncsu.edu/watershedss/info/no3.html, McCabe et al., 1985

This will promote the growth of aquatic plants, which may deplete the oxygen from the water that many native species need to survive.

Nitrogen and phosphate levels are monitored in the watershed creeks to determine nutrient loading on Lopez Lake, and subsequently, on the Terminal Reservoir. When total phosphorus levels exceed 0.025 mg/L in lakes and reservoirs, excessive or nuisance growths of algae and other aquatic plants may be stimulated (EPA Quality Criteria for Water 1986). According to North Carolina State's "WATERSHEDSS" program, "the increasing concentration of available phosphorus allows plants to assimilate more nitrogen before the phosphorus is depleted. Thus, if sufficient phosphorus is available, high concentrations of nitrates will lead to phytoplankton and macrophyte production."² Man-made nutrient sources of nitrates and phosphorus (generally in the form of orthophosphate) are typically chemical fertilizers. Another potential source is domesticated animals kept in close proximity to creeks. These nutrients are soluble. Whatever amount is not taken up by plants in a field, garden, or lawn, is washed away into groundwater, streams, ponds, and lakes or reservoirs. A rise in nutrients, such as phosphorus and nitrogen, could lead to algal blooms in Lopez Lake or the Terminal Reservoir. Excessive nutrient loads can contribute to eutrophication, causing negative impacts on aquatic ecosystems, and water quality (Carpenter et al., 1998). In 2016, the County of San Luis Obispo was experiencing an extreme drought. During the drought Arroyo Grande Creek, Clapboard Canyon Creek, Wittenberg Creek Arm and Vasquez Creek weren't flowing. All creeks (except Vasquez Creek) were flowing in 2017. Vasquez Creek is known as a subterranean creek/stream. A subterranean creek, is a creek that flows above and below ground. While underground the water goes through a "subterranean nutrient cycling" (Lewis Thomas, *Science Findings*, 2004). This cycle helps with the purification and water quality of the stream. In Table 5, both Wittenberg Creek Arm and Arroyo Grande Creek had higher nitrate and phosphate levels. Raw data can be found in Appendix B2 through B4.

Limnology and Physical Summary

High concentrations of certain algae can impact taste and odor, clog filters, and cause an increased chlorine demand in the water. From April through the end of October, staff monitors algae levels in the reservoirs weekly. The District treats the Terminal Reservoir with an algaecide before algae bloom become a significant problem.

Odor levels of the Terminal Reservoir raw water have exceeded the secondary MCL of 3 TON as shown in Table 6, but the treatment process is able to remove most objectionable odors prior to delivery to the consumer.

Lopez Lake normally develops a thermocline at a depth of 20 to 40 feet during the summer months. Water from the epilimnion (above the thermocline) typically contains dissolved oxygen in excess of 5 mg/L. This is sufficient for aerobic life forms and will minimize dissolved manganese. Algal concentrations are typically greatest near the water surface and can contribute to unacceptable odors. Epilimnion water below the surface algae and above the thermocline is preferred for delivery to the Terminal Reservoir. In the cooler months, the surface water temperature drops and the reservoir "turns over." The colder and denser surface water sinks and blends with the bottom water which contains less dissolved oxygen and more dissolved metals. Hydrogen sulfide may also be present. Dissolved metals can exert an oxidant demand at the water treatment plant. The District may use a combination of chlorine, potassium permanganate, and chlorine dioxide to oxidize iron and manganese. Powdered activated carbon is used at the plant influent to treat odor problems.

In 2017, the laboratory started using an electronic microscope (FlowCam) to classify and count algae at the lake and terminal reservoirs. The FlowCam is more quantitative and is designed to help provide a better understanding of how dense the algae may be in the environment. Enumeration of algae has helped with early detection of HABs. By knowing how much blue-green algae is in a sample we can determine the HAB risk factor by performing an algal toxin screen (data in Appendix B6). These harmful algal blooms (HABs) are often composed of microorganisms known as cyanobacteria that may produce toxins that can cause adverse health effects in humans and animals (see Agal Toxin section for more details). Algae results can be seen in Table 7.

In 2016-2017, lake levels were increasing at a rapid rate due to a heavy rainy season. During the first couple of months in 2017 the lake had a lot of debris and field data was affected.

2018	13.19
2019	29.2
2020	10.45
Total	99.06

Radiological Summary

Testing for gross alpha emitting elements (which include the alpha emitting radioactive elements Radium-226 and Uranium-238) is conducted every nine years on the plant effluent water. Radiological monitoring was performed in 2013, and will be due again in 2022. The last monitoring occurred in 2004. The highest level of gross alpha particle activity detected was 1.53 pCi/L, well below the 15 pCi/L MCL. No change is expected in gross alpha concentrations in the foreseeable future.

Volatile and Synthetic Organic Chemicals Summary

Arroyo Grande Creek, Clapboard Canyon Creek, Lopez Creek, the Influent to Terminal, Lopez Treatment Plant Raw, Lopez Treatment Plant Treated, and Delivered Water were sampled for VOCs in 2012. No VOCs were detected except for the expected THMs in the Treated and Delivered water samples.

Arroyo Grande Creek, Lopez Creek, Influent to Terminal, Lopez Treatment Plant Raw, Lopez Treatment Plant Treated, and Delivered Water were sampled for VOCs in 2015. Other than the expected THMs in the Treated and Delivered water samples, no VOCs were detected.

Influent to Terminal, Lopez Treatment Plant Raw, and the Lopez Treatment Plant Treated were sampled for SOCs in 2018. No SOCs were detected. The next sampling event for SOC's are scheduled for 2027.

Monitoring for VOCs is conducted every three years in January. Additional monitoring for SOCs is conducted every nine years. Synthetic or volatile organic compounds are not seen as a significant water quality threat to the watershed at this time. No changes in potential contaminating activities were identified in the last five years and none are anticipated in the foreseeable future.

Algal Toxins

Cyanobacteria, other freshwater algae, and their toxins are on the EPA's Contaminant Candidate List. The Contaminant Candidate List (CCL) is a list of contaminants that are currently not subject to any proposed or promulgated national primary drinking water regulations, but are known or anticipated to occur in public water systems. Contaminants listed on the CCL may require future regulation under the Safe Drinking Water Act (SDWA). For more information, please go to the EPA's website at <https://www.epa.gov/ccl/contaminant-candidate-list-4-ccl-4-0.3>.

³ <https://www.epa.gov/ccl/what-epa-does-ccl>

Cyanotoxins, from certain types of blue-green algae, in high concentrations have been known to cause illness, paralysis and even death in livestock and wildlife. Algae which have been known to produce toxins, such as Aphanizomenon, Anabaena, Microcystis, and Oscillatoria were found at Lopez Lake and the Terminal Reservoir during certain times of the year. The District attempts to treat algae at the Terminal Reservoir using copper sulfate and/or PAK®27 (a blue-green algaecide from Peroxide Solutions) before it becomes a problem. The California Water Quality Control Board regulates aquatic pesticide application at Lopez Lake and Terminal under a general NPDES permit. This permit regulates the frequency, application amount, and aquatic pesticide used for algae treatment.

The District routinely monitors algae levels. When a blue green algae bloom greater than 2000 cells/mL is detected at Lopez Lake and/or the Terminal Reservoir, sampling and testing for algal toxins is performed. This testing is conducted in the surface water at a depth of approximately 3 feet and from the Lopez Lake intake in use.

In 2018, the State Water Resources Control Board detected microcystins in a concentrated surface sample. The water being used from the lake and sent to the Terminal Reservoir was sampled for algal toxins and toxins were not detected. Algal toxin general information and Caution signs were posted at the reservoir for recreational users.

Based on cyanotoxin testing results and or visual indicators confirming the presence of Harmful Algal Blooms, the State requires each body of water to post an advisory level, CAUTION, WARNING or DANGER (Figure 12 & 13).

CAUTION

Harmful algae may be present in this water.
For your family's safety:

- You can swim in this water, but stay away from algae and scum in the water.
- Do not let pets and other animals go into or drink the water, or eat scum on the shore.
- Keep children away from algae in the water or on the shore.
- Do not drink this water or use it for cooking.
- For fish caught here, throw away guts and clean fillets with tap water or bottled water before cooking.
- Do not eat shellfish from this water.

Call your doctor or veterinarian if you or your pet get sick after going in the water.
For more information on harmful algae, go to <https://mywaterquality.ca.gov/habs/index.html>
For local information, contact: County of San Luis Obispo Environmental Health 805-781-5544

WARNING

Toxins from algae in this water can harm people and kill animals

- No swimming.
- Stay away from scum, and cloudy or discolored water.
- Do not use this water for drinking or cooking.
Boiling or filtering will not make the water safe.
- For fish caught here, throw away guts and clean fillets with tap water or bottled water before cooking.
- For people, the toxins can cause:
 - Skin rashes, eye irritation
 - Diarrhea, vomiting
 - Convulsions and death

Call your doctor or veterinarian if you or your pet get sick after going in the water.
For more information on harmful algae, go to <https://mywaterquality.ca.gov/habs/index.html>
For local information, contact:

DANGER

Toxins from algae in this water can harm people and kill animals

- Stay out of the water until further notice.
Do not touch scum in the water or on shore.
- Do not let pets or other animals drink or go into the water or go near the scum.
- Do not eat fish or shellfish from this water.
- Do not use this water for drinking or cooking.
Boiling or filtering will not make the water safe.
- For people, the toxins can cause:
 - Skin rashes, eye irritation
 - Diarrhea, vomiting
 - Convulsions and death
- For animals, the toxins can cause:
 - Skin rashes, eye irritation
 - Diarrhea, vomiting
 - Convulsions and death

Call your doctor or veterinarian if you or your pet get sick after going in the water.
For more information on harmful algae, go to <https://mywaterquality.ca.gov/habs/index.html>
For local information, contact: County of San Luis Obispo Environmental Health 805-781-5544

Figure 12: Algal Bloom and Toxin Signage

Finding more information on Harmful Algae Blooms (HABs)

The State has an interactive map showing which sites were tested for HABs at the following link: https://mywaterquality.ca.gov/habs/where/freshwater_events.html

During the summer months approximately 75% of the lakes and rivers are associated with a recommended advisory. For more information on HABs , please visit the link below:

https://mywaterquality.ca.gov/habs/resources/faqs_for_hab_signs.html

A satellite imagery detection map can be located at the following link: <https://fhab.sfei.org/>

Mercury Levels in Fish at Lopez Lake

In 2020 the California Office of Environmental Health Hazard Assessment (OEHHA) compared chemical levels of mercury found in fish caught at Lopez Lake to levels considered safe for human consumption. OEHHA had issued a safe eating advisory for seven fish species at Lopez Lake: Black Bass, Brown Bullhead, Crappie, Inland Silverside, Sacramento Sucker, Sunfish species and Threadfin Shad. For more information, please visit the link below:

[https://oehha.ca.gov/media/downloads/advisories/factlopezlake111020.pdf.](https://oehha.ca.gov/media/downloads/advisories/factlopezlake111020.pdf)

Mercury is a metal found naturally in rocks and soil. It can be released into the environment from soil erosion, mining, and forest fires. Certain bacteria and chemical processes can convert mercury from the environment into a form of mercury that accumulates easily in body tissue. This form of mercury moves up the food chain until it accumulates in some fish to unsafe levels. Once fish are consumed, mercury can damage the brain and nervous system, especially in developing fetuses and children. Mercury has not been detected in the raw water or treated drinking water. The allowable limit for mercury in drinking water is two parts per billion.

For fish species found in Lopez Lake that are not included in this advisory, OEHHA recommends following the [statewide advisory for eating fish from California lakes and reservoirs without site-specific advice](#).

AGRICULTURE CROP LAND USE

Pesticide/ Herbicide

The Lopez area is known for their crops, vineyards, and farmland. Wine grapes and orchard crops are primarily grown within the 43,000-acre watershed. Pesticide usage is required to be reported to the County of San Luis Obispo Agriculture Commissioner's Office. During the past five years on average 13,500-acre average per year or about 20 percent of the watershed has pesticide usage. Over the last five years we can see a decline in the amount of pesticides being used (See Table 10). Areas of the watershed where pesticides are being used can be seen in Figure 14 and 15. Details of pesticide data can be found in Appendix C.

Table 9: Summary of Pesticides Usage 2016-2020

Summary of All Pesticide Usage 2016-2020			
Year	Treated Amount (Acre)	Treated Amount (Gallons)	Treated Amount (Pounds)
2016	15629	4409	14572
2017	14801	4711	10964
2018	14583	4665	10530
2019	11412	4105	6835
2020	10927	4357	5485
Average	13470	4449	9677

LAKE PROGRAMS

Invasive Mussel Prevention Program

Quagga and Zebra mussels are invasive species of bivalves that originate from the Black and Caspian Seas. Using their byssal threads, these mussels can latch onto any surface, damage boats, infrastructure and water delivery systems, and will reproduce by the millions every year. Since they were first discovered in the Great Lakes in the 1980s, these invasive mussels have “hitchhiked” their way into 29 states within the U.S., including Arizona, Nevada, Colorado, and California, all since 2005.

To help **PREVENT** the spread of Quagga and Zebra mussels to the County of San Luis Obispo's reservoirs, officials at lakes Nacimiento, Lopez and Santa Margarita expect all boaters to comply with a **“CLEAN, DRAIN, DRY”** program. All watercraft must be **“CLEAN, DRAIN, and DRY”** upon arrival at any local lakes.

Monitoring for the presence of invasive mussels began in June 2008 and is ongoing. Park Rangers and onsite staff are trained to inspect vessel for aquatic invasive mussels. Lab staff check substrates monthly for invasive mussels. Substrates are located at the lakes Marina, fishing dock and log boom. Quagga and Zebra Mussels will attach to any surface with their byssal threads. Prevention is important not only for the lakes infrastructure but to the public and economy too. The County of San Luis Obispo has a State approved mussel prevention program.

To find out more about mussel prevention and how to help stop the spread please visit the following link: <https://www.usgs.gov/ecosystems/invasive-species-program/maps>

For most updated map of infested California lakes scan the QR code below:

No suspicious organisms or evidence of their existence in the reservoir or watershed has been observed since monitoring began.

SANITARY SURVEY UPDATE

Summary of Findings

This watershed sanitary survey update covers the period from January 2016 through December 2020. There have been no significant changes to the watershed during this period. District staff performed field evaluations of Lopez Terminal, Lopez Lake, and corresponding watershed throughout this period. The overall condition of the watershed has not changed except for the depletion of the water supply.

There is continued agricultural activity, including various crops, vineyards, cattle and horses in the Arroyo Grande arm of the Lopez Lake watershed. Increases in these activities or increases in population density have the potential for adversely impacting water quality in the watershed. Significant increases are unlikely with the present zoning regulations. (Planning Department Rural Land Use Category and Rural Combining Designation Maps are included in Appendix A.)

Horse corrals border one section of Wittenberg Creek Arm upstream from the reservoir. This could decrease water quality if corrals are not properly maintained. A large increase in human population here seems unlikely due to zoning regulations and topography. It is worth noting that there has been very little change in total coliform and *E. coli* mean and median MPN values for Whittenberg Creek Arm and Lopez Creeks during the period of this survey with the existing agricultural activity.

During the last months of 2016 (before the rainy season) Lopez Lake elevation was at a historical low. The low lake level can be seen in Figures 16 through 18. July 2016, boats were not able to launch at Lopez Lake. This highly effected the lake usage and fishing capability. During this time, we saw a lot of wildlife and new plant growth on the lakebed where there was once water. In section D, which used to be the swimming area, you could see a cement pathway that looked like an old road. The drought also affected the lake's watershed, seen in Figure 19, (Arroyo Grande Creek). Luckily in late 2016 and early 2017 we had heavy rain that helped with lake levels. However, with a fast-rising lake, came debris and turbid water. Debris can be seen in the picture in Figure 32.

2016-2020 Watershed Sanitary Survey

Figure 18: Lopez Lake Section B Dry

Figure 19: Stagnant water can be seen at a non-flowing Arroyo Grande Creek

The sewage collection facility within the Lopez Recreation Area is still considered to be the biggest threat to the watershed. The Lopez Recreation Area sewer system is now operated by a subcontractor hired by the County Parks and Recreation Department. The facility is regularly inspected and maintained, mitigating the potential for a contaminating event. Keeping the sludge ponds closest to the creek and lake out of service also helps mitigate this threat. All sludge waste is shipped out of the watershed. The force sewer main crossing over Wittenberg Creek Arm and the sewage disposal area continues to be inspected routinely (Figure 21). The force sewer main piping has some evidence of rust on the outer layer (Figure 22). Although sewer overflows were reported during the period of this survey (Figure 20), no sewage entered Lopez Lake or any surface water within the watershed. For more information, see link below.

https://www.waterboards.ca.gov/water_issues/programs/sso/sso_map/sso_pub.shtml

Figure 22: Sewer Force Main Wear or Corrosion

County of San Luis Obispo
Lopez Lake and Terminal Reservoir
2016-2020 Watershed Sanitary Survey

Quarterly all four wastewater percolation Ponds are inspected by County Staff (Figures 23 and 24). The ponds are located on the back side of Lopez Lake across from Wittenberg Creek Arm.

Figure 23: Wastewater Percolation Pond

Figure 24: Dry Percolation Pond

As stated in the previous survey, and as shown in Figure 25, the Terminal Reservoir watershed boundary was updated based on a visual inspection. The red line represents the watershed boundary. A diversion channel surrounds most of the Terminal Reservoir and reduces the threat of contamination from agriculture, grazing animals, and the private homes that surround the terminal (Figure 26 and 27). A small section at the south east corner of the watershed, east of Orcutt Road, is not protected by the diversion channel. Following sustained heavy rains, this section has the potential for draining onto Orcutt Road. Orcutt Road drainage continues to be a potential problem, with runoff making its way into the Terminal Reservoir.

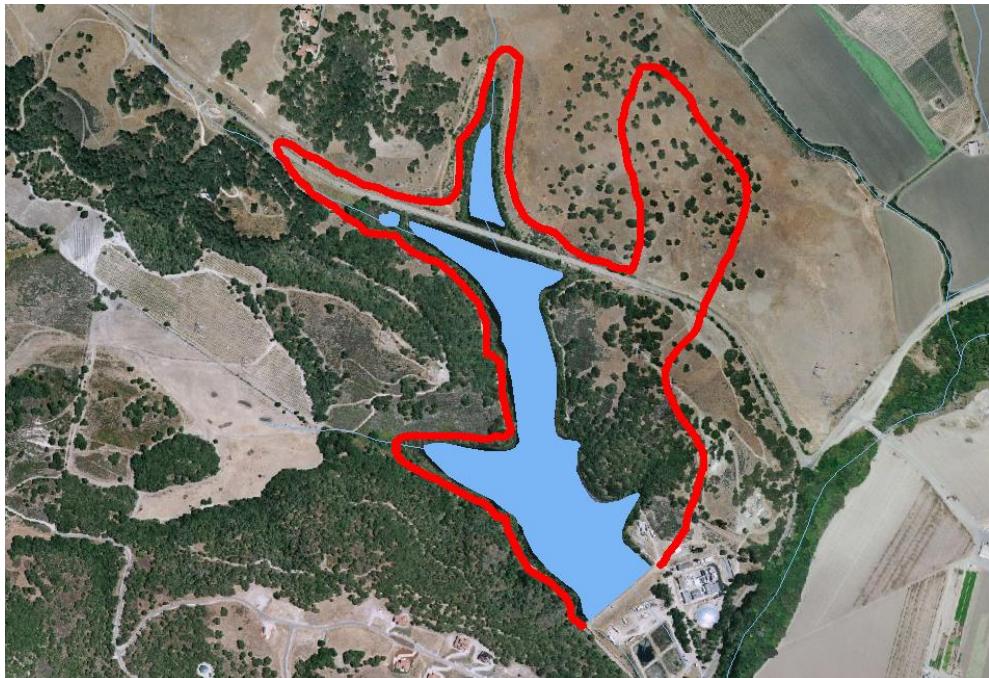

Figure 25: Lopez Terminal Reservoir Watershed Boundary

Figure 26: Diversion Channel

Figure 27: Terminal Reservoir Watershed Section Not Protected by Diversion Channel

County of San Luis Obispo
Lopez Lake and Terminal Reservoir
2016-2020 Watershed Sanitary Survey

Access to the treatment facility is via a passcode controlled locked gate which is monitored during working hours. All visitors are required to check-in at the office. Access via private property adjacent to the treatment facility is not permitted. The most visible portions of the Terminal Reservoir watershed are protected by chain-link fencing with a barbed wire top. Barbed wire fencing surrounds the remainder of the watershed. Although fencing will not keep out a determined intruder, extending the chain-link fencing with the barbed wire top around the entire Terminal Reservoir watershed has helped to deter trespassing from casual intruders. The District provided housing at the Water Treatment Plant for two employees enhances watershed security during non-working hours. See fencing in figures 28 through 30.

Figure 28: Key Pad coded lock to get into Lopez Terminal and WTP

Figure 29: Terminal Reservoir Chain-link fencing with Barbed Wire Top.

Figure 30: Locked gate at Intake structure.

Lopez Lake delivers water to the terminal through an intake infrastructure located in section F. To insure the best water quality is being delivered to Lopez Terminal, lab personnel continue to take field measurements monthly/weekly. Samples are also taken at Influent to Terminal and Influent to Plant weekly. The Log boom is used to protect the intake structure from recreational user and large debris. Seen in Figure 31 through 32 is the log boom and debris that could potentially impact the delivery or release of water from the intake Lopez's intake structure can be seen in Figure 33.

Sanitary Survey Recommendations

Recommendation 1 - Potential Hazardous Spills

The ability to bypass the Terminal Reservoir could provide a quick, workable solution if a hazardous materials spill occurred on Orcutt Road. The 18" bypass was pressure tested and visually inspected in 2019 and determined to be in good condition. The ability to bypass the terminal reservoir seems feasible. The Health and Safety code prohibits direct use of any reservoir water stored for domestic use that has had body contact (from swimming, water skiing, etc). Legislative change at the State level would be required in order to use water directly from Lopez Lake at the Lopez WTP. Continue to evaluate the options of diverting Orcutt Road drainage away from the Terminal Reservoir in case of a hazardous materials transportation spill.

Recommendation 2 - Terminal Reservoir Watershed Security

Consider the purchase of adjacent property east of the treatment facilities. Acquiring the property would improve watershed security and provide easier access to the District's "Domestic Tank" which stores potable water for the site.

Recommendation 3:

Investigate further treatment options, and vendors, to help combat odor issues when there is a presence of MIB and geosmin.

Recommendation 4:

The District should continue to make efforts to limit the amount of grazing in and around the watershed areas, including Lopez Terminal Reservoir and Lopez Lake.

Recommendation 5:

Continue to add fencing around the Terminal Reservoir watershed as needed, especially in areas not visible from the treatment plant site.

Recommendation 6:

Monthly samples should continue to be tested at all organized swimming beaches in the Lopez Lake Recreation Area.

Recommendation 7:

The scope of the inflow creek sampling program should be maintained and/or expanded in terms of scope and frequency

Recommendation 8:

Develop a public education brochure or newsletter that is sent out to residents or given to visitors of Lopez Lake and watershed areas. This educational handout will include information about how to protect the watershed and lake from items such as: wildfire, nutrient overload, and invasive species.

Recommendation 9:

Add bromide monitoring to the Influent to Terminal and Influent to Plant and bromate monitoring to delivered water monthly for possible future ozone treatment.

Recommendation 10:

Add Enterococcus monitoring in the swim area (Section D) or Section C monthly at Lopez Lake and Influent to Terminal weekly.

Water Quality Monitoring Program

The following sample matrix summarizes suggested sampling for the Lopez Project watersheds (See Table 10).

Table 10: Water Quality Monitoring Matrix-System Compliance with New and Future

W = Weekly sampling; M = Monthly sampling; W/M = Weekly or monthly sampling based on the season; Q = Quarterly sampling; A = Annual sampling; 3 = Sampling every 3 years; 9 = Sampling every 9 years; FD = following toxin detection in Terminal

SYSTEM COMPLIANCE WITH NEW AND FUTURE REGULATIONS

Long Term 2 Enhanced Surface Water Treatment Rule

The Long Term 2 Enhanced Surface Water Treatment Rule (LT2ESWTR) applies to all systems that use surface or ground water under the direct influence of surface water. This rule supplements other existing regulations by targeting *Cryptosporidium* and other pathogenic microorganisms in drinking water. Since all historical testing has not detected any *Cryptosporidium* in the Raw or Treated water, Lopez Project is classified in the lowest risk category, which carries no additional treatment requirement. Beginning in October of 2015, samples were collected on a monthly basis for cryptosporidium as part of the LT2ESWTR. Sampling was completed in 2017. All samples have been found to be non-detect. Lopez Project will continue monitor *Cryptosporidium* and other pathogenic microorganisms. The Lopez Project has fully complied with the LT2ESWTR.

Per- and polyfluoroalkyl substances (PFAS) Information

Drinking water containing perfluorooctanoic acid (PFOA), perfluorooctanesulfonic acid (PFOS) – and the larger family of per- and polyfluoroalkyl substances (PFAS) – has become an increasing concern due to the persistence of these chemicals in the environment and their tendency to accumulate in groundwater. Per- and polyfluoroalkyl substances (PFAS) are a group of man-made chemicals used to make fluoropolymer coatings and products that resist heat, oil, stains, grease, and water.⁴

PFAS have been manufactured and used in a variety of industries around the globe, including in the United States since the 1940s. The most extensively produced and studied PFAS chemicals are per-fluoro-octane sulfonic acid (PFOS), perfluorooctanoic acid (PFOA), and perfluorobutane sulfonic acid (PFBS). These chemicals are very persistent in the environment and in the human body – meaning they don't break down and they can accumulate over time.

Although no longer manufactured in the United States, they are still produced internationally and can be imported into the United States in consumer goods such as carpet, leather and apparel, textiles, paper and packaging, coatings, rubber and plastics. PFAS can be found in:

- Food packaged in PFAS-containing materials, processed with equipment that used PFAS, or grown in PFAS-contaminated soil or water.

⁴ https://www.waterboards.ca.gov/publications_forms/publications/factsheets/docs/pfoa_pfos_guidelines_faq_factsheet.pdf

- Commercial household products, including stain- and water-repellent fabrics, nonstick products (e.g., Teflon), polishes, waxes, paints, cleaning products, and fire-fighting foams (a major source of groundwater contamination at airports and military bases where firefighting training occurs).
- Workplace, including production facilities or industries (e.g., chrome plating, electronics manufacturing or oil recovery) that use PFAS.
- Drinking water, typically localized and associated with a specific facility (e.g., manufacturer, landfill, wastewater treatment plant, firefighter training facility).
- Living organisms, including fish, animals and humans, where PFAS have the ability to build up and persist over time.

There is evidence that exposure to PFAS can lead to adverse health outcomes in humans. Studies indicate that PFOA and PFOS can cause reproductive and developmental, liver and kidney, and immunological effects in laboratory animals. Both chemicals have caused tumors in animals. The most consistent findings are increased cholesterol levels among exposed populations, with more limited findings related to:

- low infant birth weights,
- effects on the immune system,
- cancer (for PFOA), and
- thyroid hormone disruption (for PFOS and PFBS).

Many chemicals in this group have been a concern because they do not break down in the environment, can move through soils and contaminate drinking water sources, and they build up (bioaccumulate) in fish and wildlife. PFAS have been found in rivers and lakes and in many types of animals on land and in the water.

While toxicity studies have raised important concerns, there is still much we do not know about the effects of PFAS on human health and the environment. Out of the hundreds of known PFAS compounds, only a small number have been studied extensively. We do not know how much PFAS exposure is safe for humans or whether there are important differences in toxicity between different PFAS compounds. And we do not fully understand how PFAS compounds break down in the environment over time and how they travel.⁵

In August 2019, the California State Water Resources Control Board (State Water Board), Division of Drinking Water (DDW) established notification levels (NL) for perfluorooctane

⁵ Monitoring Monday – Let's look at PFAS; State Water Resource Control Board, March 2021

sulfonate (PFOS) at **6.5 parts per trillion (ppt)** and perfluorooctanoic acid (PFOA) at **5.1 ppt**. In March 2021, DDW established a NL of **500 ppt** for perfluorobutane sulfonic acid (PFBS).

Notification levels are nonregulatory, health-based advisory levels established for contaminants in drinking water for which maximum contaminant levels have not been established. Notification levels are established as precautionary measures for contaminants that may be considered candidates for establishment of maximum contaminant levels but have not yet undergone or completed the regulatory standard setting process prescribed for the development of maximum contaminant levels and are not drinking water standards.

A response level has also been established for these analytes. A response level (RL) is set higher than a notification level and represents a recommended chemical concentration level at which water systems consider taking a water source out of service or provide treatment if that option is available to them. Starting in January 2020, water systems that receive an order and detect levels of PFAS substances that exceed their response level, shall take a water source out of use, treat the water delivered, or provide public notification (See Table 11).

Table 11: PFAS Notification Limit Table

Analyte	Notification Level, ng/L	Response Level, ng/L (running four quarter average)
PFBS	500	5000
PFOA	5.1	10
PFOS	6.5	40

Not all public water system's are required to test for PFAS. A public water system may have received an order because it may be at risk for potential contamination by PFAS due to its proximity to adjacent facilities known to use, produce, or store PFAS or because of proximity to a public water system whose water supply is contaminated by PFAS. A list of public water systems and sources that are required to be sampled are located at the link below. The State Water Resources Control Board, Division of Water Quality information can be found at:

https://www.waterboards.ca.gov/water_issues/programs/pfas/⁶

At this time, Lopez Project is not required to test for PFAS substances.

⁶ State Water Resources Control Board Per- and Poly-fluoroalkyl Substances (PFAS) Water Monitoring Fact Sheet, https://www.waterboards.ca.gov/drinking_water/certlic/drinkingwater/documents/pfoss_and_pfoa/pfas%20faq_final.pdf

SECURITY OF WATERSHED AND TREATMENT FACILITIES

A security and vulnerability assessment has been completed for the system. The County is a member of the Water ISAC Water Security Network.

The Lopez Terminal Reservoir and Water Treatment Plant facility are entirely fenced with chain-linked or barbed wire fencing. "No trespassing" signs are prominently posted around the facility. The remoteness of the treatment facility and the housing of two District employees at the site enhance security.

Access to the Lopez Water Treatment Plant is controlled by a locked entrance gate. All visitors are required to sign-in at the plant's main office.

Other than an occasional fisherman, trespassing in the Lopez Terminal watershed has not been a problem. When trespassers are encountered, they are asked to leave. If they refuse or are problematic in any way, the County of San Luis Obispo Sheriff Department is notified and asked to respond.

Overall the security of the Lopez Lake, Terminal Reservoir, and treatment facilities are good. New fencing around sections of the Terminal Reservoir has improved site security.

DESCRIPTION OF WATERSHED CONTROL AND MANAGEMENT PRACTICES

The following summarizes watershed control and management practices currently used.

- The Lopez Lake Recreation Area is inspected no less than weekly and an "Inspection of Domestic Water Reservoir Facilities" report is submitted monthly to the California Department of Public Health.
- The Terminal Reservoir provides 30 to 45 days of detention time (The Terminal allows for sedimentation and "solar/UV" disinfection prior to treatment.).
- All the grazing permits for areas adjoining the Lopez Lake were revoked.

- The wastewater plant is located at the opposite end of the lake from the intake structure.
- The wastewater plant effluent percolation pond disposal area is remote (>1/2 mile) from lake and intake structure (~3 miles).
- The District has an established water quality monitoring program for the Lopez Lake and Terminal Reservoir watersheds.
- The closed/restricted zone at the Lopez Lake intake area includes posted buoys and a cable log boom.
- Public access to Lopez Lake is controlled and routed through the main gate of the park.
- The Lopez Terminal Reservoir is fenced and posted.
- No public access is allowed to the Terminal Reservoir.
- SLO County Parks (General Services) and Utilities (Public Works) oversee lake management.
- There are an adequate number of Parks and Utilities personnel for management of the watershed.
- Significant portions of the watershed are designated wilderness areas, with associated use restrictions.
- Boating on Lopez Lake is only allowed when the lake is patrolled.
- Fueling facilities are located off the lake and have acceptable secondary containment precautions.
- No fuel storage is allowed on Lopez Lake or the Terminal Reservoir.
- No floating facilities requiring sewage disposal are permitted.
- Patrol personnel enforce California Harbor and Navigation Code as well as local regulations.
- Fish cleaning facilities with adequate water supply and disposal systems provided and are set back at least 100 feet from the lake. No overflow from the facilities into the lake is allowed.
- Swimming facilities are located down-wind of the intake structure, at the opposite end of the lake.
- Toilets are conveniently located and properly maintained.
- Toilets are emptied or cleaned daily in developed areas.
- Toilets are set back at least 200 feet from the high water line.
- Chemical toilets are seasonally available and located at least 50' from the water line.
- Hook-ups are provided for trailers, campers, etc.
- A sewage dump station is provided at Lopez Lake.
- There are no septic tanks around Lopez Lake.
- Septic tanks for facilities near Lopez Terminal are located remotely and "downstream" of the Terminal Reservoir.
- Sewers and appurtenances are located above the Lopez Lake high water mark.

- Sewage facilities are alarmed and designed to prevent overflow.
- The waterslide facility at Lopez Lake is properly operated and does not drain into the lake.
- Sewer force mains are designed to be fail-safe.
- Emergency storage and standby power is available.
- The sewer system is operated and maintained by trained and experienced staff of Fluid Resource Management.
- Treatment plant operators are on-call and available 24 hours/day.
- Wastewater effluent disposal to Lopez Lake is prohibited.
- Surface drainage is diverted from the sewage treatment and disposal facilities.
- A surface drainage diversion culvert is located around the Terminal Reservoir (except for Orcutt Road).
- Dumping of refuse into the water or along shoreline is prohibited. Acceptable refuse containers are located conveniently around Lopez Lake. Containers are anchored as needed and are routinely inspected and emptied. Refuse is properly transported and disposed.
- Equestrian corrals, stables, staging areas at Lopez Lake are located at the opposite end from the intake structure.
- Storm water drainage from stables or corral areas is prevented from entering the reservoir as much as is feasible.
- There is an emergency plan for handling actual or threatened water contamination.
- The public is notified (posted) that terminal is a drinking water reservoir. Lake users are informed that lake is ultimately a drinking water supply for South County residents.
- The County Agriculture Department issues pesticide use permits for pesticide use in the watershed.
- The County maintains an Aquatic Invasive Mussel Monitoring and Prevention Program

CONCLUSION

Overall, the condition of the watersheds remains very good.

Wastewater contamination, animal grazing, recreational activities, pesticide/herbicide usage, fires, earthquakes, and landslides continue to represent the most significant potential sources of contamination in the Lopez Lake watershed. Monitoring of the watershed should be continued with particular attention paid to Lopez Creek (with the greatest flow) and Arroyo Grande Creek (with the greatest potential for contaminating activities).

Continued attention should be placed on mitigating the potential impact of a hazardous material spill on Orcutt Road. Recognizing that conveying drainage from Orcutt Road to an unlined pond outside the Terminal Reservoir watershed remains cost prohibitive.

Given the potential for algal toxins and the taste and odor problems associated with algal blooms, reducing the occurrence and magnitude of algal blooms should remain a priority. This is especially true for the Lopez Terminal Reservoir. Prevention or reduction of blooms by non-algaecide methods is preferable.
